## WEBVTT

- 1.00:00:01.020 --> 00:00:02.850 < v -> All right, I'm very excited </v>
- $2\ 00:00:02.850 \longrightarrow 00:00:04.170$  to introduce our speaker for today.
- $3\ 00:00:04.170 \longrightarrow 00:00:05.880$  We have Dr. Meghan Short.
- $4\ 00:00:05.880 --> 00:00:07.800$  Dr. Short has completed fellowships
- $5~00:00:07.800 \longrightarrow 00:00:09.870$  at the Glenn Biggs Institute for Alzheimer's
- $6\ 00:00:09.870 --> 00:00:11.940$  and Neurodegenerative Diseases,
- $7\ 00:00:11.940 --> 00:00:14.310$  and at Harvard's Huttenhower Lab.
- $8~00:00:14.310 \longrightarrow 00:00:16.500$  Currently, Dr. Short is an assistant professor
- $9\ 00:00:16.500 \longrightarrow 00:00:17.610$  at Tufts University.
- $10\ 00:00:17.610 --> 00:00:19.593$  Let's give a warm welcome to Dr. Short.
- 11 00:00:31.200 --> 00:00:33.250 <v ->Hi, everyone, Thank you for being here.</v>
- 12 00:00:34.110 --> 00:00:34.943 Can you all hear me, okay?
- $13\ 00:00:34.943 \longrightarrow 00:00:36.453 < v \longrightarrow Sign in if you're registered. < /v >$
- 14 00:00:38.280 --> 00:00:40.860 <v -> All right, so, today, I'm going to talk about a project </v>
- $15\ 00:00:40.860 \longrightarrow 00:00:43.410$  that I worked on as part of my postdoc
- $16\ 00:00:43.410 --> 00:00:45.930$  down at UT Health San Antonio
- 17 00:00:45.930 --> 00:00:48.930 with the Glenn Biggs Institute for Alzheimer's
- $18\ 00:00:48.930 --> 00:00:51.000$  and Neurodegenerative Diseases,
- $19\ 00:00:51.000 --> 00:00:53.990$  and I wanted to talk about this as a...
- $20\ 00:00:56.070$  --> 00:00:58.140 None of the sort of methods that I'm gonna talk about
- $21\ 00:00:58.140 \longrightarrow 00:01:00.810$  in this talk are particularly new.
- $22\ 00:01:00.810 \dashrightarrow 00:01:03.750$  This wasn't sort of a methods development project.
- $23~00{:}01{:}03.750 \dashrightarrow 00{:}01{:}07.890$  So the sort of main network method I'll talk about
- 24 00:01:07.890 --> 00:01:10.200 is about a decade old at this point, at least,
- $25\ 00:01:10.200 \longrightarrow 00:01:12.570$  but what's nice about it is that
- $26\ 00:01:12.570 \longrightarrow 00:01:14.700$  with increasing availability

- 27 00:01:14.700 --> 00:01:16.800 of high dimensional biomedical data,
- $28\ 00:01:16.800 \longrightarrow 00:01:19.530$  it's sort of seeing more use cases,
- 29~00:01:19.530 --> 00:01:21.750 and it's not something that, at least, I learned about
- 30 00:01:21.750 --> 00:01:24.270 in my graduate program in biostatistics,
- $31\ 00:01:24.270 \longrightarrow 00:01:25.830$  but it's something that I thought
- 32 00:01:25.830 --> 00:01:27.750 would be good to talk about today
- $33\ 00:01:27.750 \longrightarrow 00:01:29.350$  since it's such a useful method.
- $34\ 00:01:31.860 \longrightarrow 00:01:34.800$  So let's see if I advance.
- $35\ 00:01:34.800 \longrightarrow 00:01:36.360$  There we go.
- 36 00:01:36.360 --> 00:01:39.390 So I'll start just by giving a quick introduction.
- $37~00{:}01{:}39.390 \dashrightarrow 00{:}01{:}43.320~I$  know that when I was in grad school, I always wanted,
- 38 00:01:43.320 --> 00:01:44.400 I thought it was interesting
- $39\ 00:01:44.400 \longrightarrow 00:01:45.870$  to hear about people's career paths
- $40\ 00:01:45.870 \longrightarrow 00:01:47.343$  as I was considering my own.
- $41\ 00:01:48.330 \longrightarrow 00:01:52.980$  So I started in biology as a field.
- 42 00:01:52.980 --> 00:01:55.503 I studied salt marsh ecology as an undergrad,
- $43\ 00:01:56.370 \longrightarrow 00:01:57.570$  and then by the end of undergrad,
- $44\ 00{:}01{:}57.570 \dashrightarrow 00{:}02{:}00.240$  I was interested in getting more into sort of a human,
- 45 00:02:00.240 --> 00:02:02.490 more directly human-focused environment,
- $46\ 00:02:02.490 \longrightarrow 00:02:04.650$  and so I considered public health.
- $47\ 00:02:04.650 \longrightarrow 00:02:05.760$  I learned about statistics
- $48\ 00:02:05.760 \longrightarrow 00:02:07.530$  as part of my research in undergrad
- $49\ 00:02:07.530$  --> 00:02:10.830 and wanted to continue with that so I participated in SIBS,
- 50 00:02:10.830 --> 00:02:13.597 which is a program that you may be aware of,
- 51 00:02:13.597 --> 00:02:16.221 and that was my first intro to biostat.
- 52 00:02:16.221 --> 00:02:19.260 I was a graduate student at Boston University.
- 53~00:02:19.260 --> 00:02:20.790 I had for tune of working
- 54 00:02:20.790 --> 00:02:22.110 with the Framingham Heart Study,

- $55\ 00:02:22.110 \longrightarrow 00:02:23.520$  which is where the data comes from
- $56~00{:}02{:}23.520 \dashrightarrow 00{:}02{:}25.590$  that I'll be talking to you about today,
- 57 00:02:25.590 --> 00:02:26.880 which is a really interesting study,
- $58\ 00:02:26.880 \longrightarrow 00:02:29.460$  and I'll get more details on in the few slides.
- $59\ 00:02:29.460 \longrightarrow 00:02:30.720$  That was sort of my introduction
- $60\ 00:02:30.720 \longrightarrow 00:02:32.673$  to working with epidemiological data.
- 61 00:02:33.750 --> 00:02:35.610 After grad school, I continued on,
- 62 00:02:35.610 --> 00:02:38.130 again, to UT Health San Antonio,
- $63~00:02:38.130 \longrightarrow 00:02:41.850$  and then following that to postdoc at Harvard
- $64\ 00:02:41.850 \longrightarrow 00:02:46.850$  looking at developing methods for microbiome analysis.
- 65 00:02:47.310 --> 00:02:48.720 So if you have any interest in that,
- $66\ 00:02:48.720 \longrightarrow 00:02:50.910$  feel free to approach me,
- 67 00:02:50.910 --> 00:02:53.160 although I'm not gonna talk about that today,
- $68\ 00:02:54.270 \longrightarrow 00:02:56.910$  and then as of March this year,
- 69 00:02:56.910 --> 00:03:00.480 I started as an assistant professor at Tufts Medicine
- $70\ 00:03:00.480 -> 00:03:02.370$  where I'm working on a variety of projects
- $71\ 00:03:02.370 \longrightarrow 00:03:06.210$  but a lot related to sort of omics data
- 72 00:03:06.210 --> 00:03:08.433 and aging and longevity.
- $73\ 00:03:12.150 \longrightarrow 00:03:15.090$  So I'll start today's talk with a bit of motivation
- 74~00:03:15.090 --> 00:03:18.450 for why network-based analyses we're a good fit
- $75\ 00{:}03{:}18.450$  -->  $00{:}03{:}22.863$  for looking at sort of the proteome in Alzheimer's disease.
- $76\ 00:03:24.000 --> 00:03:26.700$  So first of all, Alzheimer's disease
- $77\ 00:03:26.700 \longrightarrow 00:03:29.520$  is a very prevalent condition.
- $78\ 00{:}03{:}29.520 \dashrightarrow 00{:}03{:}32.700$  Many of you may be like me and know some family members
- $79\ 00:03:32.700 --> 00:03:36.030$  or people who have been affected by it.
- $80~00:03:36.030 \longrightarrow 00:03:39.870$  It's very common and expect it to be more so
- $81\ 00:03:39.870 --> 00:03:43.860$  as populations age, and it's a leading cause of mortality,

- 82 00:03:43.860 --> 00:03:46.830 disability, and poor health among seniors,
- $83\ 00:03:46.830 \longrightarrow 00:03:49.080$  and one interesting feature of this disease
- $84\ 00:03:49.080 --> 00:03:51.960$  is that precursors of it can appear years to decades
- $85\ 00:03:51.960 \longrightarrow 00:03:54.750$  before symptoms manifest.
- $86~00{:}03{:}54.750 \longrightarrow 00{:}03{:}57.600$  So those precursors can include indicators
- $87\ 00:03:57.600 \longrightarrow 00:03:59.913$  that are visible on brain MRIs,
- $88\ 00:04:00.900 \longrightarrow 00:04:04.623$  performance on neurocognitive testing, changes in gait,
- 89 00:04:05.460 --> 00:04:08.070 even changes in sense of smell,
- $90\ 00:04:08.070 --> 00:04:13.070$  and cerebral spinal fluid markers, such as tau and amyloid.
- 91 00:04:17.460 --> 00:04:21.060 Because of this, there's interest in being able to find
- 92 00:04:21.060  $\rightarrow$  00:04:23.550 plasma biomarkers for Alzheimer's disease
- 93  $00:04:23.550 \longrightarrow 00:04:25.320$  and related dementias.
- $94~00{:}04{:}25.320 \dashrightarrow 00{:}04{:}28.323$  ADRD is a acronym we'll be using sort of throughout.
- $95\ 00:04:29.940 --> 00:04:32.750$  Because since there are indicators
- 96 00:04:32.750 --> 00:04:34.680 of sort of pre-disease development
- $97\ 00:04:34.680 \longrightarrow 00:04:37.320$  in years to decades before being able to detect those,
- 98 00:04:37.320  $\rightarrow$  00:04:40.380 either earlier or in a less invasive or expensive way,
- 99 00:04:40.380 --> 00:04:44.430 is very useful,
- $100\ 00:04:44.430$  --> 00:04:49.430 and so when I say invasive, I mentioned CSF markers,
- $101\ 00:04:49.650 \longrightarrow 00:04:53.160$  such as how an amyloid can predict dementia,
- 102 00:04:53.160 --> 00:04:55.560 but that involves doing a lumbar puncture
- $103\ 00:04:55.560 \longrightarrow 00:04:59.733$  versus something like a blood draw, which is easier to do.
- $104\,00{:}05{:}00.990 {\:\raisebox{---}{\text{---}}}> 00{:}05{:}04.410$  Another good aspect of trying to find biomarkers

- $105\ 00{:}05{:}04.410 \dashrightarrow 00{:}05{:}07.440$  is that you can get a sense of biological processes
- 106 00:05:07.440 --> 00:05:10.290 that are involved in disease development,
- $107\ 00{:}05{:}10.290 \dashrightarrow 00{:}05{:}13.440$  and that can hopefully lead to either preventative
- $108\ 00:05:13.440 \longrightarrow 00:05:15.183$  or the apeutic interventions.
- $109\ 00:05:19.260 \longrightarrow 00:05:21.240$  What makes this difficult?
- 110 00:05:21.240 --> 00:05:24.390 So in my case, I was looking at proteins.
- $111\ 00:05:24.390 \longrightarrow 00:05:27.120$  There are thousands and thousands to select from,
- $112\ 00:05:27.120 \longrightarrow 00:05:29.610$  and you get sort of this inherent trade off
- $113\ 00:05:29.610 \longrightarrow 00:05:32.610$  between trying to control a false positive rate
- $114\ 00{:}05{:}32.610 \dashrightarrow 00{:}05{:}36.000$  for all these multiple tests that you may be performing,
- $115\ 00{:}05{:}36.000 {\:{\mbox{--}}\!>} 00{:}05{:}38.940$  but if you effectively control the false positive rate,
- $116\ 00:05:38.940 --> 00:05:42.330$  you're going to likely end up with low statistical power.
- $117\ 00:05:42.330 \longrightarrow 00:05:44.640$  There's this trade off between...
- $118\ 00:05:44.640 \longrightarrow 00:05:47.220$  It's sort of a needle in a haystack.
- $119\ 00:05:47.220 \longrightarrow 00:05:49.950$  Another thing that has tended to be true
- $120\ 00{:}05{:}49.950 \dashrightarrow 00{:}05{:}53.370$  is that there is not very good replicability across studies.
- 121 00:05:53.370 --> 00:05:57.330 So one study may find 20 biomarkers
- $122\ 00:05:57.330 \longrightarrow 00:05:58.860$  and maybe one or two of them
- 123 00:05:58.860 --> 00:06:01.230 may replicate in a different study.
- $124\ 00{:}06{:}01.230 \dashrightarrow 00{:}06{:}04.563$  So there's a lot of noise that ends up coming through.
- 125 00:06:07.950 --> 00:06:10.350 The approach that I took in this project
- $126\ 00:06:10.350 \longrightarrow 00:06:12.960$  was to use network analysis
- 127 00:06:12.960 --> 00:06:17.040 to analyze the protein data,
- $128\ 00:06:17.040 \longrightarrow 00:06:19.920$  and the motivation there is to try and capture
- $129\ 00:06:19.920 --> 00:06:23.400$  subtle but consistent variation in groups of proteins.

- 130 00:06:23.400 --> 00:06:26.733 I'll refer to them as modules during this talk.
- 131 00:06:27.915 --> 00:06:30.060 In then just a few things, so first of all,
- $132\ 00:06:30.060 \longrightarrow 00:06:31.620$  it reduces the dimensionality
- $133\ 00{:}06{:}31.620$  -->  $00{:}06{:}34.890$  of the statistical testing problem that you have.
- $134\ 00:06:34.890 \longrightarrow 00:06:37.050$  So rather than testing each protein individually
- $135\ 00:06:37.050 --> 00:06:40.187$  and having to adjust for all of those multiple tests,
- $136\ 00:06:40.187 --> 00:06:43.080$  you can sort of reduce the space
- $137\ 00:06:43.080 \longrightarrow 00:06:45.660$  to a smaller number of tests
- $138\ 00:06:45.660 --> 00:06:49.230$  where the proteins within each group being tested
- 139 00:06:49.230 --> 00:06:51.130 are inter-correlated with one another,
- $140\ 00{:}06{:}51.990 {\:{\mbox{--}}\!>\:} 00{:}06{:}54.660$  and unlike other dimensionality reduction methods,
- 141 00:06:54.660 --> 00:06:56.640 something like a principle components analysis
- 142 00:06:56.640 --> 00:06:59.490 that you may have maybe familiar with,
- $143\ 00:06:59.490 \longrightarrow 00:07:02.651$  the network method has sort of a benefit of looking
- $144\ 00:07:02.651 \longrightarrow 00:07:05.580$  not just at, say, correlations
- $145\ 00:07:05.580 \longrightarrow 00:07:08.550$  or relationships between pairs of proteins,
- $146\ 00:07:08.550 \dashrightarrow 00:07:11.070$  but, also, at sort of the correlational neighborhood
- 147 00:07:11.070 --> 00:07:12.750 of what common neighbors
- $148\ 00:07:12.750 \longrightarrow 00:07:14.613$  those proteins share in the network.
- $149\ 00:07:18.270 \longrightarrow 00:07:22.230$  Another benefit of or sort of way
- $150\ 00:07:22.230 --> 00:07:23.347$  that we try to get around some of the pitfalls
- $151\ 00{:}07{:}23.347 \dashrightarrow 00{:}07{:}28.347$  of proteomic analysis is by focusing on biological pathways
- $152\ 00:07:29.130 \longrightarrow 00:07:31.890$  instead of on individual proteins themselves.
- $153\ 00{:}07{:}31.890 \dashrightarrow 00{:}07{:}35.670$  So within groups of proteins that we find to be of interest

 $154\ 00:07:35.670 \longrightarrow 00:07:39.750$  or possibly associated with dementia outcomes,

 $155\ 00:07:39.750 \longrightarrow 00:07:43.200$  we use a tool called over-representation analysis,

156 00:07:43.200 --> 00:07:44.670 which I'll talk about later,

 $157\ 00:07:44.670 --> 00:07:48.030$  but it essentially tries to pinpoint biological pathways

 $158\ 00:07:48.030 \longrightarrow 00:07:50.790$  that may be overrepresented by the proteins

 $159\ 00{:}07{:}50.790 \dashrightarrow 00{:}07{:}54.468$  that are found to be associated with the outcome,

 $160\ 00:07:54.468 \longrightarrow 00:07:56.280$  and the hope there is to find,

 $161\ 00:07:56.280$  --> 00:08:01.230 to get sort of insights that are more robust across studies

162 00:08:01.230 --> 00:08:03.000 and, hopefully, address some of the issues

 $163\ 00:08:03.000 \longrightarrow 00:08:04.113$  with replicability.

 $164\ 00:08:07.830 --> 00:08:11.280$  Okay, so that's sort of the motivation for this study,

 $165\ 00:08:11.280 --> 00:08:13.773$  and, now, I'll talk a little bit about the data.

166 00:08:18.030 --> 00:08:19.140 The data for this study

167 00:08:19.140 --> 00:08:21.720 comes from the Framingham Heart Study,

 $168\ 00:08:21.720 \longrightarrow 00:08:23.880$  which has been going on for a very long time.

 $169\ 00{:}08{:}23.880 \dashrightarrow 00{:}08{:}28.880$  It started in 1948 in a town of Framingham, Massachusetts,

170 00:08:29.190 --> 00:08:30.660 and at the time they enrolled,

 $171\ 00:08:30.660 \longrightarrow 00:08:33.510$  they reached out to two-thirds of the population of the town

 $172\ 00{:}08{:}33.510 \dashrightarrow 00{:}08{:}35.940$  to try and enroll them in this epidemiological study.

 $173\ 00:08:35.940 \longrightarrow 00:08:38.043$  It was one of the first ones of its kind,

 $174\ 00:08:39.030 \longrightarrow 00:08:42.390$  and people would come in for exams every few years,

 $175\ 00:08:42.390 \longrightarrow 00:08:44.640$  and they would take all of this information about them,

 $176\ 00:08:44.640 \longrightarrow 00:08:47.413$  and then follow them for outcomes.

- $177\ 00:08:47.413 --> 00:08:49.320$  Cardiovascular outcomes was really
- $178\ 00:08:49.320 --> 00:08:52.533$  the sort of outcome of interest when it first started.
- 179 00:08:53.490 --> 00:08:56.730 Over the years, they've then enrolled offspring
- $180\ 00:08:56.730 --> 00:08:59.010$  of the original cohort participants
- 181 00:08:59.010 --> 00:09:02.130 as well as grandchildren and third generation,
- $182\ 00:09:02.130 \longrightarrow 00:09:05.880$  and then as sort of the demographics
- 183 00:09:05.880 --> 00:09:08.640 of Framingham have changed over the years,
- 184 00:09:08.640 --> 00:09:10.140 if you're only enrolling descendants
- 185 00:09:10.140 --> 00:09:11.790 of people who live there in 1948,
- $186\ 00:09:11.790 \longrightarrow 00:09:13.020$  you're not gonna capture that.
- $187\ 00:09:13.020 --> 00:09:15.450$  So they also have been enrolling omni cohorts
- $188\ 00:09:15.450$  --> 00:09:18.897 to reflect sort of more diverse populations (indistinct).
- 189 00:09:20.910 --> 00:09:23.100 Again, they were sort of aiming
- $190\ 00:09:23.100 --> 00:09:25.050$  towards identifying risk factors
- 191 00:09:25.050 --> 00:09:28.560 and etiologies of cardiovascular disease,
- 192 00:09:28.560 --> 00:09:30.780 but as those populations age,
- $193\ 00:09:30.780 \longrightarrow 00:09:34.304$  brain health and cognition is also an important outcome,
- $194\ 00{:}09{:}34.304 {\: -->\:} 00{:}09{:}38.850$  and so they've measured sort of cognitive outcomes
- $195\ 00{:}09{:}38.850 \longrightarrow 00{:}09{:}41.370$  and incidents of dementia as well, and, of course,
- $196\ 00:09:41.370 \longrightarrow 00:09:44.133$  those things are also related to cardiovascular.
- 197 00:09:48.210 --> 00:09:50.850 For our study in particular,
- $198\ 00:09:50.850 \longrightarrow 00:09:53.130$  we were using the offspring cohort,
- 199 00:09:53.130 --> 00:09:55.470 and at their examination cycle five,
- $200\ 00:09:55.470 \longrightarrow 00:09:59.520$  which was in the early 90s, they collected blood samples,
- 201 00:09:59.520 --> 00:10:02.880 and froze the plasma from those samples,
- 202 00:10:02.880 --> 00:10:06.300 and years later, when they sort of had

 $203\ 00:10:06.300 \dashrightarrow 00:10:10.500$  these broader proteomic analysis assays available,

204 00:10:10.500 --> 00:10:13.680 they measured the plasma proteome,

 $205\ 00:10:13.680 \longrightarrow 00:10:16.773$  I'll talk about the methods for that on the next slide,

 $206\ 00:10:17.940 \longrightarrow 00:10:20.550$  but they did this in about 1,900 participants

 $207\ 00:10:20.550 \longrightarrow 00:10:23.820$  who were approximately aged 55 when the blood was drawn.

208 00:10:23.820 --> 00:10:26.250 So this is sort of a middle-aged cohort,

209 00:10:26.250 --> 00:10:28.120 generally, cognitively healthy

 $210\ 00:10:29.100 \longrightarrow 00:10:30.873$  and a little more than half women.

 $211\ 00:10:32.640 \longrightarrow 00:10:35.490$  The main outcomes that we looked at in this study

 $212\ 00{:}10{:}35.490 \dashrightarrow 00{:}10{:}40.490$  are MRI-based measures, so brain MRIs were taken

213 00:10:41.310 --> 00:10:45.120 about 10 years or so, five to 10 years

 $214~00:10:45.120 \dashrightarrow 00:10:50.120$  after the initial blood draws, and those had...

215 00:10:50.730 --> 00:10:54.060 The sort of outcomes that I looked at there are

 $216\ 00{:}10{:}54.060 \dashrightarrow 00{:}10{:}57.390$  total brain volume as well as the volume of the hippocampus

 $217\ 00:10:57.390 \longrightarrow 00:11:00.750$  and then a measure called white matter hyperintensities,

 $218\ 00:11:00.750 \longrightarrow 00:11:05.133$  which is sort of a measure of vascular injury in the brain,

 $219\ 00:11:06.300 \longrightarrow 00:11:10.200$  and a reason to look at those outcomes is that

220 00:11:10.200 --> 00:11:12.780 I mentioned there are sort of precursors of dementia

 $221\ 00{:}11{:}12.780 \dashrightarrow 00{:}11{:}16.140$  or risk factors for dementia that can be identified on MRI,

 $222\ 00:11:16.140 \longrightarrow 00:11:17.690$  those are some of the big ones.

223 00:11:19.080 --> 00:11:21.660 Especially since we had a middle-aged cohort,

224 00:11:21.660 --> 00:11:23.907 you may not see a lot of incident dementia,

225 00:11:23.907 --> 00:11:26.520 and so being able to detect proteins

- $226\ 00{:}11{:}26.520 \dashrightarrow 00{:}11{:}29.400$  that are associated with some of those precursors
- 227 00:11:29.400 --> 00:11:32.283 is a way of getting at this issue.
- $228\ 00:11:33.840 \longrightarrow 00:11:35.640$  We did also look at incident dementia.
- 229 00:11:35.640 --> 00:11:37.380 So we had about 20 years of follow-up,
- 230 00:11:37.380 --> 00:11:39.570 which is one of the strengths of this,
- 231 00:11:39.570 --> 00:11:42.300 looking in this particular sample,
- $232\ 00:11:42.300 \longrightarrow 00:11:45.930$  and we had 128 incidences of dementia
- $233\ 00:11:45.930 \longrightarrow 00:11:47.820$  of which 94 of them were classified
- 234 00:11:47.820 --> 00:11:49.413 as Alzheimer's type dementia.
- $235\ 00:11:53.190 --> 00:11:55.260$  We also had a replication cohort.
- 236 00:11:55.260 --> 00:11:57.690 I mentioned the importance replication,
- $237\ 00:11:57.690 \longrightarrow 00:12:00.000$  and so we worked with collaborators
- $238\ 00{:}12{:}00.000 \dashrightarrow 00{:}12{:}03.930$  at the University of Washington and their cohort study
- 239 00:12:03.930 --> 00:12:05.550 called the Cardiovascular Health Study,
- $240\ 00{:}12{:}05.550 \dashrightarrow 00{:}12{:}08.610$  which has sites, I think, four different sites around the US
- $241\ 00{:}12{:}08.610 \dashrightarrow 00{:}12{:}13.290$  and has measures of the same proteomic platform
- $242\ 00{:}12{:}13.290 \to 00{:}12{:}16.053$  and same outcomes that we're looking at in the study.
- 243 00:12:19.410 --> 00:12:22.530 The assay that we used to measure proteins
- 244 00:12:22.530 --> 00:12:24.180 is called SOMAScan.
- 245 00:12:24.180 --> 00:12:26.670 It's by this company called SomaLogic.
- $246\ 00:12:26.670 \longrightarrow 00:12:29.430$  They use these single-stranded DNA aptamers
- $247\ 00:12:29.430 \dashrightarrow 00:12:31.320$  that are designed to specifically bind
- $248~00{:}12{:}31.320 \dashrightarrow 00{:}12{:}34.818$  to different proteins, and you can sort of tag them
- $249\ 00:12:34.818 \longrightarrow 00:12:37.724$  that way and measure their concentrations.
- 250 00:12:37.724 --> 00:12:42.120 In our sample, the assay had 1,300 proteins,
- 251 00:12:42.120 --> 00:12:44.580 which that's even sort of becoming dated now.
- $252\ 00:12:44.580 \longrightarrow 00:12:46.470$  I think the latest version

- $253\ 00:12:46.470 \longrightarrow 00:12:48.300$  has something like 7,000 proteins.
- $254\ 00{:}12{:}48.300 \dashrightarrow 00{:}12{:}50.580$  So there's a lot that can be measured with this,
- 255 00:12:50.580 --> 00:12:55.203 but there is some sort of bias towards, I think,
- $256\ 00:12:56.850 \longrightarrow 00:12:59.190$  molecules that sort of have some evidence
- $257\ 00:12:59.190 \longrightarrow 00:13:01.080$  of being important in cardiovascular disease.
- $258\ 00:13:01.080 \dashrightarrow 00:13:04.743$  So it's not an entirely sort of agnostic choice of proteins,
- 259 00:13:05.793 --> 00:13:07.893 but it does get a pretty wide range.
- $260\ 00{:}13{:}10.620 \dashrightarrow 00{:}13{:}14.730$  Okay, so that's a description of the data,
- 261 00:13:14.730 --> 00:13:16.920 and, now, I want to dig in a bit
- $262\ 00:13:16.920 \longrightarrow 00:13:19.083$  to the network methods that we used.
- 263 00:13:20.010 --> 00:13:24.390 So this is sort of a graphical abstract
- 264 00:13:24.390 --> 00:13:26.253 from their original paper,
- $265\ 00:13:28.080 \longrightarrow 00:13:29.460$  describing this weighted gene
- $266\ 00:13:29.460 --> 00:13:31.413$  correlation network analysis method.
- $267\ 00:13:32.310 \longrightarrow 00:13:34.410$  So that's what WGCNA stands for.
- $268\ 00{:}13{:}34.410 \dashrightarrow 00{:}13{:}37.159$  I put gene in parentheses because they've started
- $269\ 00{:}13{:}37.159 \dashrightarrow 00{:}13{:}40.290$  dropping that from the name when it gets used elsewhere
- $270\ 00:13:40.290 --> 00:13:42.330$  because, originally, it was developed
- 271 00:13:42.330 --> 00:13:45.180 for gene expression data, but it's been found to have use
- $272\ 00:13:45.180 \longrightarrow 00:13:48.240$  in other high dimensional data sets as well,
- $273\ 00{:}13{:}48.240 \dashrightarrow 00{:}13{:}52.380$  and so in our case, we're using it to analyze proteins,
- $274\ 00{:}13{:}52.380 {\:{--}{>}\:} 00{:}13{:}56.463$  but the language here makes reference to gene expression.
- 275 00:13:57.450 --> 00:14:00.621 So just broadly, what this method does
- 276 00:14:00.621 --> 00:14:04.050 is you get a co-expression network,
- $277\ 00{:}14{:}04.050$  -->  $00{:}14{:}07.710$  and I'll sort of give details on the next few slides.

- $278\ 00:14:07.710 \longrightarrow 00:14:09.720$  but the idea is that the network is based
- $279\ 00:14:09.720 --> 00:14:13.500$  on co-occurrence or correlation in your sample.
- $280\ 00:14:13.500$  --> 00:14:16.800 So there's not really information coming from outside.
- 281 00:14:16.800 --> 00:14:18.810 You're not even considering your outcome at all.
- 282 00:14:18.810 --> 00:14:21.417 It's just looking at the space of the proteins
- $283\ 00:14:21.417 \longrightarrow 00:14:24.123$  and which proteins are correlated with one another.
- $284\ 00{:}14{:}25.620 {\:{\mbox{--}}}{>}\ 00{:}14{:}29.040$  Once you've identified this sort of network matrix,
- $285~00:14:29.040 \longrightarrow 00:14:32.100$  you use a hierarchical clustering algorithm
- $286\ 00:14:32.100 \longrightarrow 00:14:34.350$  to define modules.
- $287\ 00{:}14{:}34.350 \dashrightarrow 00{:}14{:}37.320$  It's a little small here, but I'll show a a bigger example.
- 288 00:14:37.320 --> 00:14:39.240 Basically, you have a dendrogram,
- 289 00:14:39.240 --> 00:14:41.730 and you see that if sort of proteins
- 290 00:14:41.730 --> 00:14:44.063 are on this x-axis of this figure here.
- 291 00:14:44.063 --> 00:14:46.383 I'll do the mouse for people who are online.
- $292\ 00{:}14{:}47.760 \dashrightarrow 00{:}14{:}51.150$  You get these sort of bands or groups of proteins
- 293 00:14:51.150 --> 00:14:53.340 that are highly correlated with one another
- $294\ 00:14:53.340 \longrightarrow 00:14:55.743$  and not correlated with other proteins.
- 295 00:14:57.840  $\rightarrow$  00:15:00.693 So that is where those sort of protein groups come from.
- $296~00:15:01.590 \dashrightarrow 00:15:05.790$  Once you have those, you can use a numerical summary
- $297\ 00{:}15{:}05.790 \dashrightarrow 00{:}15{:}09.780$  of each protein group as sort of a feature or a predictor
- 298 00:15:09.780 --> 00:15:12.750 in a regression or some sort of analysis
- $299\ 00:15:12.750 \longrightarrow 00:15:15.210$  to try and relate the modules or groups
- $300\ 00:15:15.210 \longrightarrow 00:15:16.440$  to external information.
- 301 00:15:16.440 --> 00:15:20.160 So that's how we relate our protein groups
- $302\ 00:15:20.160 \longrightarrow 00:15:22.743$  to dementia outcomes in this study.

- $303\ 00:15:23.880 \longrightarrow 00:15:25.200$  There's also the possibility
- $304\ 00:15:25.200 \longrightarrow 00:15:27.900$  of looking at relationships between modules.
- $305\ 00:15:27.900 --> 00:15:31.560$  So I mentioned the modules in the network
- $306\ 00:15:31.560 \longrightarrow 00:15:33.210$  are highly inter-correlated
- 307 00:15:33.210 --> 00:15:35.580 within the proteins within themselves,
- $308\ 00:15:35.580 \longrightarrow 00:15:38.362$  but there may also be some correlation between modules,
- $309\ 00:15:38.362 \longrightarrow 00:15:41.100$  and that could be important to look at as well,
- $310\ 00:15:41.100 --> 00:15:44.340$  and then within modules, you may have
- $311\ 00:15:44.340 \longrightarrow 00:15:47.340$  tens or hundreds of proteins, and so trying to figure out
- 312 00:15:47.340 --> 00:15:49.500 which proteins within those modules
- $313\ 00:15:49.500 --> 00:15:51.696$  are driving any associations you see
- $314\ 00:15:51.696 \longrightarrow 00:15:54.870$  is sort of a final step that can be
- $315\ 00:15:54.870 \longrightarrow 00:15:57.060$  useful for getting sort of biological meaning
- $316\ 00:15:57.060 \longrightarrow 00:15:58.443$  out of these associations.
- $317\ 00:16:02.070 \longrightarrow 00:16:03.240$  So that's a broad overview.
- $318\ 00:16:03.240 \longrightarrow 00:16:07.890$  This is sort of a more graphical abstract from our study,
- 319 00:16:07.890 --> 00:16:10.510 and I'll sort of go through bit by bit
- $320\ 00:16:11.430 \longrightarrow 00:16:13.683$  the different pieces of the analysis.
- 321 00:16:14.610 --> 00:16:17.580 So, again, this WGCNA step is sort of the first step
- 322 00:16:17.580 --> 00:16:19.950 of getting from this protein expression matrix
- $323\ 00{:}16{:}19.950 \dashrightarrow 00{:}16{:}23.760$  where you have sort of your proteins by participants,
- $324\ 00{:}16{:}23.760 {\: -->\:} 00{:}16{:}27.420$  and using the sort of correlations in your sample
- $325\ 00:16:27.420 ext{ --> }00:16:30.753$  to come up with these modules of co-expressed proteins.
- $326\ 00:16:33.300 \longrightarrow 00:16:35.040$  The first step in doing that
- $327\ 00:16:35.040 --> 00:16:38.760$  is to make a pairwise correlation or similarity matrix.

- 328 00:16:38.760 --> 00:16:40.293 So if you have n proteins,
- $329\ 00:16:40.293 --> 00:16:42.510$  then that becomes an n by n matrix
- $330\ 00:16:42.510 \longrightarrow 00:16:44.670$  where each cell is describing
- $331\ 00:16:44.670 \longrightarrow 00:16:47.130$  the similarity or correlation
- 332 00:16:47.130 --> 00:16:51.273 between protein i and protein j in your sample.
- $333\ 00:16:52.290 \longrightarrow 00:16:53.610$  You then use this to create
- 334 00:16:53.610 --> 00:16:56.340 what's called an adjacency matrix, which is,
- 335 00:16:56.340 --> 00:16:58.290 I'll talk about more in the next slide,
- 336 00:16:58.290 --> 00:17:00.940 but is sort of a more networky way
- $337\ 00:17:02.190 \longrightarrow 00:17:05.226$  of describing the association between proteins,
- $338\ 00:17:05.226 --> 00:17:08.070$  and then a topological overlap matrix,
- $339\ 00:17:08.070 \longrightarrow 00:17:09.990$  which then takes into account
- $340\ 00:17:09.990 --> 00:17:12.510$  not only the correlation between proteins
- $341\ 00{:}17{:}12.510 \dashrightarrow 00{:}17{:}15.750$  but their shared neighborhood, and then, again,
- $342\ 00:17:15.750 \longrightarrow 00:17:18.693$  that is what is used to cluster the proteins.
- $343\ 00:17:22.860 \longrightarrow 00:17:24.900$  So to get into a bit more detail
- 344 00:17:24.900 --> 00:17:28.143 about sort of the network construction,
- $345~00{:}17{:}30.060 \dashrightarrow 00{:}17{:}32.910$  again, you described the network as an n by n matrix
- $346\ 00:17:32.910 --> 00:17:36.180$  with the number of nodes or genes, proteins, et cetera,
- $347\ 00:17:36.180 \longrightarrow 00:17:39.210$  and, in our case, we use to describe the similarity,
- 348 00:17:39.210 --> 00:17:41.163 just a simple correlation,
- 349 00:17:42.060 --> 00:17:43.860 absolute value of the correlation,
- $350\ 00:17:43.860 --> 00:17:46.233$  between a given node i and j.
- $351\ 00:17:48.046 --> 00:17:51.420$  The adjacency is then a measure of whether or how strongly
- $352\ 00:17:51.420 \longrightarrow 00:17:53.310$  the nodes are connected in the network.
- $353\ 00:17:53.310 \longrightarrow 00:17:55.830$  So the idea being that
- $354\ 00:17:55.830 --> 00:17:57.870$  nodes that have very high correlations

- $355\ 00:17:57.870 \longrightarrow 00:17:59.730$  are particularly interesting.
- $356\ 00:17:59.730 \longrightarrow 00:18:01.830$  Nodes that have moderate to low correlations
- $357\ 00:18:01.830 \longrightarrow 00:18:03.450$  are probably not informative
- 358 00:18:03.450 --> 00:18:06.690 is sort of the underlying idea,
- 359 00:18:06.690 --> 00:18:11.690 and so if you look at sort of this figure here,
- 360 00:18:12.390 --> 00:18:15.180 the correlation or similarity is on the x-axis,
- $361~00{:}18{:}15.180 \dashrightarrow 00{:}18{:}18.991$  and then the adjacency is on the y, and so if you use
- $362\ 00:18:18.991 --> 00:18:22.260$  what's called an unweighted network approach,
- 363 00:18:22.260 --> 00:18:25.350 you pick a threshold value, here, it's 0.8,
- $364~00{:}18{:}25.350 \dashrightarrow 00{:}18{:}28.260$  and you say that anything with a similarity less than 0.8
- $365\ 00:18:28.260 \longrightarrow 00:18:31.110$  is considered to not be a connection in the network,
- $366\ 00:18:31.110 \longrightarrow 00:18:32.870$  and everything greater than 0.8
- $367\ 00:18:32.870 \longrightarrow 00:18:34.320$  is considered to be a connection.
- 368 00:18:34.320 --> 00:18:36.483 So it's sort of a binary yes or no.
- 369 00:18:38.100 --> 00:18:41.850 What WGCNA does that was novel
- 370 00:18:41.850 --> 00:18:44.610 was to introduce a weighting
- $371\ 00{:}18{:}44.610 \dashrightarrow 00{:}18{:}49.050$  where sort of the downside of this unweighted metric is that
- $372\ 00:18:49.050 \longrightarrow 00:18:52.080$  if you have a correlation of 0.79,
- $373\ 00:18:52.080 \longrightarrow 00:18:55.080$  that could be useful to know, but it counts as a zero.
- 374 00:18:55.080 --> 00:18:56.613 So you're losing information,
- $375\ 00:18:57.480 --> 00:18:59.790$  and so what the weighted network does
- 376 00:18:59.790 --> 00:19:03.330 is it uses a sort of power transformation
- $377\ 00:19:03.330 \longrightarrow 00:19:06.720$  to get from sort of the straight correlation
- $378\ 00:19:06.720 \longrightarrow 00:19:08.430$  shown in this red line,
- $379\ 00:19:08.430 \dashrightarrow 00:19:12.090$  and sort of depending on this power value that you use,

 $380\ 00:19:12.090 --> 00:19:15.673$  you weight more or less towards the higher correlations

381 00:19:15.673 --> 00:19:19.980 in your network, and when you fit this model

 $382\ 00{:}19{:}19{.}980 \dashrightarrow 00{:}19{:}23.880$  or when you sort of build the network, your choice of data

 $383\ 00:19:23.880 \longrightarrow 00:19:27.030$  is sort of one of the parameters that you choose going in,

 $384\ 00:19:27.030 \longrightarrow 00:19:29.940$  and there's ways to sort of measure

 $385\ 00:19:29.940 \longrightarrow 00:19:32.103$  which gives the best fit to the data.

 $386\ 00:19:37.980 \longrightarrow 00:19:41.490$  So then once you have your sort of unweighted

 $387\ 00:19:41.490 --> 00:19:44.550$  or weighted adjacency matrix,

 $388\ 00:19:44.550 \longrightarrow 00:19:47.790$  then is the part where you account for shared neighbors.

 $389\ 00:19:47.790 \longrightarrow 00:19:51.543$  So this is this topological overlap matrix that is created,

 $390\ 00:19:52.434$  --> 00:19:56.613 so, basically, this measure omega of connectedness.

 $391~00{:}19{:}57.960 \dashrightarrow 00{:}20{:}00.810$  The equation, I don't find super sort of intuitive,

 $392\ 00:20:00.810 \longrightarrow 00:20:03.120$  but the components are...

 $393\ 00:20:03.120 --> 00:20:05.370$  This is the sum, so u are, basically,

394~00:20:05.370 --> 00:20:07.110 all of the nodes other than i and j

 $395\ 00{:}20{:}07.110 \dashrightarrow 00{:}20{:}09.930$  that you're looking at the connectedness between,

396 00:20:09.930 --> 00:20:11.490 and so you're summing up

397 00:20:11.490 --> 00:20:15.240 the sort of common connection strength between i and u

 $398\ 00:20:15.240 \longrightarrow 00:20:18.120$  and j and u as a product.

 $399~00:20:18.120 \longrightarrow 00:20:21.690$  So if I and J both have a strong connection

 $400\ 00:20:21.690 --> 00:20:25.953$  to this other node, then that's adding to this term 1,

 $401\ 00:20:27.240 \longrightarrow 00:20:28.890$  and then these k terms here

 $402\ 00{:}20{:}28.890 \dashrightarrow 00{:}20{:}32.010$  are just the individual connections between, no,

- 403 00:20:32.010 --> 00:20:34.290 each sort of the node i of interest
- $404\ 00:20:34.290 \longrightarrow 00:20:35.840$  and other nodes in the network,
- $405\ 00{:}20{:}36.870 \dashrightarrow 00{:}20{:}41.460$  but I find sort of the easiest or most intuitive explanation
- $406\ 00:20:41.460 \longrightarrow 00:20:45.930$  from this original paper shows that for the unweighted case,
- $407\ 00{:}20{:}45.930 \dashrightarrow 00{:}20{:}49.560$  omega is equal to one if the node with fewer connections
- $408\ 00:20:49.560 \longrightarrow 00:20:51.360$  has all of its neighbors,
- $409\ 00:20:51.360 --> 00:20:52.920$  also, has connections of the other node.
- $410\ 00:20:52.920 \longrightarrow 00:20:55.350$  So the connections of node i
- $411\ 00:20:55.350 \longrightarrow 00:20:58.530$  are a subset of the connections of node j,
- $412\ 00:20:58.530 \longrightarrow 00:21:00.750$  and, also, i and j are directly connected.
- $413\ 00:21:00.750 \longrightarrow 00:21:02.520$  So that's sort of the most interconnected
- 414 00:21:02.520 --> 00:21:03.920 that those two nodes can be,
- $415\ 00:21:04.770 \longrightarrow 00:21:07.740$  and then the least interconnected they can be
- 416 00:21:07.740 --> 00:21:09.690 is if they are not connected to one another,
- 417 00:21:09.690 --> 00:21:10.920 and they don't share any neighbors.
- $418\ 00:21:10.920 \longrightarrow 00:21:13.200$  So that would be sort of the zero case.
- $419\ 00:21:15.510 \longrightarrow 00:21:17.970$  So this a value can either take on
- 420 00:21:17.970 --> 00:21:19.950 the unweighted or the weighted case,
- 421 00:21:19.950 --> 00:21:22.710 and in our sample with WGCNA,
- $422\ 00{:}21{:}22.710$  -->  $00{:}21{:}26.250$  we're using those sort of weighted network connections
- 423 00:21:26.250 --> 00:21:27.990 that just adds more information
- $424\ 00:21:27.990 --> 00:21:30.693$  into this topological overlap matrix.
- 425 00:21:36.107 --> 00:21:36.940 Okav.
- $426\ 00:21:39.150 --> 00:21:44.150$  So, now, once you have the topological overlap matrix.
- $427\ 00{:}21{:}44.850 \dashrightarrow 00{:}21{:}47.970$  again, this measure of sort of interconnectedness
- 428 00:21:47.970 --> 00:21:49.743 accounting for shared neighbors,
- 429 00:21:50.670 --> 00:21:53.250 then you can use hierarchical clustering

- 430 00:21:53.250 --> 00:21:56.700 to divide those proteins
- 431 00:21:56.700 --> 00:21:59.373 into groups based on their similarity,
- $432\ 00:22:00.390 \longrightarrow 00:22:03.480$  and this is the results from our analysis.
- $433\ 00:22:03.480 \longrightarrow 00:22:06.060$  So sort of on the x-axis,
- $434\ 00:22:06.060 \longrightarrow 00:22:09.030$  you have the different proteins, you have the dendrogram,
- 435 00:22:09.030 --> 00:22:11.130 which represents the hierarchical clustering
- 436 00:22:11.130 --> 00:22:13.950 of the topological overlap matrix,
- $437\ 00{:}22{:}13.950 \dashrightarrow 00{:}22{:}18.950$  and then you have this dynamic tree cut algorithm
- $438\ 00:22:19.867 \longrightarrow 00:22:22.020$  which then defines these clusters
- $439\ 00:22:22.020 \longrightarrow 00:22:26.010$  which are shown in colors on the bottom based on the tree.
- $440\ 00:22:26.010 --> 00:22:28.380$  So you see this huge branch down here.
- $441\ 00:22:28.380 \longrightarrow 00:22:30.030$  That's gonna be this black cluster.
- 442 00:22:30.030 --> 00:22:32.343 There's this other cluster over here in green,
- 443 00:22:33.360 --> 00:22:36.660 and so there's, again, a few more parameters
- $444\ 00:22:36.660 --> 00:22:40.110$  that you can use to decide how those cuts are made,
- $445\ 00{:}22{:}40.110 \dashrightarrow 00{:}22{:}42.660$  and, in some cases, you can sort of merge branches
- $446\ 00{:}22{:}42.660 \longrightarrow 00{:}22{:}45.420$  that have correlation with one another,
- $447\ 00:22:45.420 \longrightarrow 00:22:47.670$  and my general advice
- 448 00:22:47.670 --> 00:22:49.290 for when you're doing this on real data
- $449\ 00:22:49.290 \longrightarrow 00:22:50.940$  is to try different values
- $450\ 00:22:50.940 --> 00:22:52.500$  and see how robust the network is
- $451\ 00{:}22{:}52.500 {\: -->\:} 00{:}22{:}56.490$  to choosing different values because, in our case,
- 452 00:22:56.490 --> 00:22:59.370 it tended to be pretty consistent
- $453\ 00{:}22{:}59.370 \dashrightarrow 00{:}23{:}02.070$  where we saw four modules pretty much regardless.
- 454 00:23:02.070 --> 00:23:03.600 I think if we merged,

- $455\ 00:23:03.600 \longrightarrow 00:23:05.820$  if we really cranked up one of the merging parameters,
- $456\ 00:23:05.820 \longrightarrow 00:23:06.653$  we would get to three,
- $457\ 00:23:06.653 --> 00:23:09.453$  but other than that it sort of stayed put.
- 458 00:23:12.900 --> 00:23:13.733 Okay.
- $459\ 00:23:15.150 --> 00:23:17.850$  So the next step is trying to get
- $460\ 00{:}23{:}17.850 --> 00{:}23{:}22.290$  a numerical summary measure of the groups of proteins
- 461 00:23:22.290 --> 00:23:25.140 that we've identified from our network.
- $462\ 00{:}23{:}25.140 --> 00{:}23{:}28.380$  So from these modules of co-expressed proteins.
- $463\ 00:23:28.380 \longrightarrow 00:23:32.940$  we then use, basically, a principle components analysis
- $464\ 00:23:32.940 \longrightarrow 00:23:35.220$  to get what we call an eigenprotein
- $465\ 00:23:35.220 \longrightarrow 00:23:38.790$  or it was called an eigen gene in the original paper.
- $466\ 00:23:38.790 \longrightarrow 00:23:42.510$  What it is is, essentially, a weighted sum
- $467\ 00:23:42.510 \longrightarrow 00:23:46.530$  of the values of each of the proteins in the module,
- $468\ 00{:}23{:}46.530 \dashrightarrow 00{:}23{:}50.220$  and the weights correspond to sort of how well correlated
- $469\ 00:23:50.220 \longrightarrow 00:23:52.560$  that protein is with the overall module.
- $470\ 00:23:52.560 \longrightarrow 00:23:55.500$  So if a protein has a high weight in the module,
- $471\ 00:23:55.500 --> 00:23:58.410$  it means that it's sort of the most interconnected
- $472\ 00{:}23{:}58.410 \dashrightarrow 00{:}24{:}02.733$  in the module or sort of best represents the overall module.
- $473\ 00:24:03.900 \longrightarrow 00:24:06.000$  So each person is going to have
- 474 00:24:06.000 --> 00:24:10.173 an eigenprotein value for each module,
- 475 00:24:16.020 --> 00:24:18.180 and when we look at the sort of weights
- $476\ 00:24:18.180 \longrightarrow 00:24:22.314$  within each of the modules, so just to sort of orient us,
- $477\ 00{:}24{:}22.314 \longrightarrow 00{:}24{:}27.000$  on the x-axis are each of the module eigengenes

- $478\ 00:24:27.000 \longrightarrow 00:24:32.000$  or eigenproteins, and then each sort of bar
- $479\ 00:24:33.630 \longrightarrow 00:24:36.390$  on the y is a different protein.
- $480\ 00:24:36.390 \longrightarrow 00:24:38.880$  In this case, we're only including
- 481 00:24:38.880 --> 00:24:41.970 proteins that fall into one of the four modules.
- $482\ 00:24:41.970 --> 00:24:45.240$  There were, also, if you notice on the last slide,
- $483\ 00{:}24{:}45.240 \dashrightarrow 00{:}24{:}47.910$  plenty of proteins that didn't fall into any module
- $484\ 00:24:47.910 \longrightarrow 00:24:50.940$  and were sort of the extras, so to speak,
- $485\ 00:24:50.940 \longrightarrow 00:24:53.670$  and if you were to expand this down
- 486 00:24:53.670 --> 00:24:56.160 and include more rows with those,
- $487\ 00:24:56.160 \longrightarrow 00:25:00.000$  that would sort of show those, but for purposes of this,
- $488\ 00:25:00.000 \longrightarrow 00:25:01.020$  we're just including ones
- 489 00:25:01.020 --> 00:25:03.020 that fell into at least one of the four,
- $490\ 00:25:04.198 \longrightarrow 00:25:08.520$  and each of these bars represents a correlation
- $491\ 00:25:08.520 \longrightarrow 00:25:10.620$  between the individual protein
- $492\ 00:25:10.620 \longrightarrow 00:25:12.363$  and the overall eigenprotein.
- $493\ 00:25:13.260 \longrightarrow 00:25:14.823$  So for these blocks of red,
- 494 00:25:14.823 --> 00:25:16.950 it's sort of the higher weighted proteins
- $495\ 00:25:16.950 \longrightarrow 00:25:20.580$  that are within in this example module one,
- 496~00:25:20.580 --> 00:25:23.583 module two, three, and four, and then you can see.
- $497\ 00:25:24.450 -> 00:25:27.990$  if you look sort of laterally from these proteins,
- $498\ 00:25:27.990 \longrightarrow 00:25:30.060$  it's the correlation of these proteins
- $499\ 00:25:30.060 \longrightarrow 00:25:31.230$  with the other modules.
- $500~00:25:31.230 \dashrightarrow 00:25:35.580$  So the idea being we wanna see sort of blocks of red,
- $501\ 00:25:35.580 \longrightarrow 00:25:37.500$  and then not a lot of correlation
- $502~00{:}25{:}37.500 \dashrightarrow 00{:}25{:}40.440$  between the blocks and other modules,
- $503\ 00:25:40.440 --> 00:25:42.093$  which is what we see.
- $504~00{:}25{:}46.020 \dashrightarrow 00{:}25{:}49.590$  All right, now that we've constructed our network,

- $505\ 00:25:49.590 --> 00:25:52.290$  and we've come up with numerical summary measures
- $506\ 00:25:52.290 \longrightarrow 00:25:55.500$  for each of the protein groups that we've identified,
- $507\ 00:25:55.500 \longrightarrow 00:25:58.500$  that is sort of the input or the predictor
- $508\ 00:25:58.500 \longrightarrow 00:26:01.860$  for these associations with outcomes.
- 509 00:26:01.860 --> 00:26:04.080 So for the MRI measures, which, again,
- 510 00:26:04.080 --> 00:26:07.080 our total brain volume, hippocampal volume,
- 511 00:26:07.080 --> 00:26:08.790 and white matter hyperintensities,
- 512 00:26:08.790 --> 00:26:11.520 we use just a simple or, you know,
- 513 00:26:11.520 --> 00:26:14.100 linear regression with covariates,
- $514~00{:}26{:}14.100 \dashrightarrow 00{:}26{:}16.830$  and then a Cox proportional hazards regression,
- $515~00:26:16.830 \longrightarrow 00:26:20.310$  we use to predict incident dementia
- 516 00:26:20.310 --> 00:26:23.163 and, specifically, Alzheimer's type dementia.
- $517\ 00:26:25.560 \longrightarrow 00:26:27.720$  These are the regression equations.
- 518 00:26:27.720 --> 00:26:29.910 Again, these eigenproteins are,
- $519\ 00:26:29.910 \longrightarrow 00:26:31.740$  they're sort of one for each module.
- $520\ 00:26:31.740 --> 00:26:34.620$  So we'll run a separate regression analysis
- 521 00:26:34.620 --> 00:26:37.350 for modules one, two, three, and four.
- $522~00{:}26{:}37.350 \dashrightarrow 00{:}26{:}41.820$  We adjust for age and age squared, sex education.
- 523 00:26:41.820 --> 00:26:44.220 APOE is a gene that confers a lot of risk
- 524 00:26:44.220 --> 00:26:45.270 for Alzheimer's disease.
- 525 00:26:45.270 --> 00:26:46.767 So it's associated with the outcomes,
- 526 00:26:46.767 --> 00:26:48.807 and we include it as a covariate,
- 527~00:26:48.807 --> 00:26:51.240 and then a measure of time lag
- $528~00{:}26{:}51.240 \dashrightarrow 00{:}26{:}53.040$  between when the blood was sampled
- $529~00{:}26{:}53.040 \dashrightarrow 00{:}26{:}56.652$  and when the MRI was taken to account for any differences
- $530\ 00:26:56.652 --> 00:26:59.733$  between people or the time difference,
- $531~00{:}27{:}01.170 \dashrightarrow 00{:}27{:}05.790$  and for dementia, it's slightly simpler regression equation.

- $532\ 00:27:05.790 --> 00:27:09.123$  We only adjust for age, sex, and APOE status.
- 533 00:27:13.410 --> 00:27:16.590 All right, so next, I will show
- 534 00:27:16.590 --> 00:27:19.653 the results in the Framingham Heart Study.
- $535\ 00:27:20.670 \longrightarrow 00:27:24.030$  So from the four modules that we tested,
- $536\ 00:27:24.030 --> 00:27:26.580$  there were two that we identified to have
- $537\ 00:27:26.580 \longrightarrow 00:27:28.890$  some association with outcomes.
- $538\ 00:27:28.890 \longrightarrow 00:27:31.170$  The first is module two.
- $539\ 00:27:31.170 --> 00:27:34.560\ I$  gave it sort of a name clearance and synaptic maintenance,
- 540 00:27:34.560 --> 00:27:36.630 and I'll talk about how I arrived
- $541\ 00:27:36.630 \longrightarrow 00:27:39.660$  at that name for the module in a bit.
- $542\ 00:27:39.660 \longrightarrow 00:27:42.093$  It has 165 proteins in it.
- $543\ 00:27:43.830 --> 00:27:46.680$  Some of the half weighted proteins sort of give an idea
- $544\ 00:27:46.680 --> 00:27:49.300$  of which ones are sort of most highly weighted
- $545~00{:}27{:}51.120 \dashrightarrow 00{:}27{:}53.763$  or sort of most correlated with the eigen protein.
- $546\ 00:27:56.160 \longrightarrow 00:27:58.560$  I'll talk about how we got to these
- $547\ 00:27:58.560 \longrightarrow 00:28:00.510$  in another slide as well,
- 548 00:28:00.510 --> 00:28:01.890 but, basically, this is from that
- $549\ 00:28:01.890 --> 00:28:03.540$  over-representation analysis
- $550~00{:}28{:}03.540 \dashrightarrow 00{:}28{:}06.480$  where you're trying to identify biological pathways
- 551 00:28:06.480 --> 00:28:09.116 that are important or overrepresented
- $552\ 00:28:09.116 \longrightarrow 00:28:12.150$  by proteins in those modules.
- $553\ 00:28:12.150 --> 00:28:14.250$  So we have the Axon guidance pathway
- $554~00{:}28{:}14.250 \dashrightarrow 00{:}28{:}19.173$  was most strongly associated with this module,
- 555 00:28:21.120 --> 00:28:24.510 and then in terms of relating to outcomes,
- 556~00:28:24.510 --> 00:28:25.710 total brain volume
- 557 00:28:25.710 --> 00:28:28.830 was the only significant association that we saw
- 558 00:28:28.830 --> 00:28:33.462 So since this is a linear aggression,

- 559~00:28:33.462 --> 00:28:37.110 effect greater than zero means a positive association.
- $560\ 00:28:37.110 \longrightarrow 00:28:39.930$  So we see that for larger values
- 561 00:28:39.930 --> 00:28:42.180 of the eigenprotein for module two,
- $562\ 00:28:42.180 --> 00:28:44.310$  we saw larger total brain volume.
- 563 00:28:44.310 --> 00:28:46.090 So it's sort of a protective effect
- $564~00{:}28{:}47.370 --> 00{:}28{:}50.913$  since brain atrophy is what is the risk factor for dementia,
- 565 00:28:52.860 --> 00:28:54.570 and then for incident dementia,
- $566\ 00:28:54.570 --> 00:28:56.220$  we did not see a significant effect
- 567 00:28:56.220 --> 00:28:58.320 after correcting our p-values
- $568\ 00:28:58.320 \longrightarrow 00:29:00.240$  using a Bonferroni correction.
- $569\ 00:29:00.240 \longrightarrow 00:29:03.660$  You'll notice that the confidence interval excludes one,
- 570 00:29:03.660 --> 00:29:04.860 which would be the null value,
- $571\ 00:29:04.860 \longrightarrow 00:29:06.200$  and that's just because that's based
- $572\ 00:29:06.200 \longrightarrow 00:29:10.260$  on the non-Bonferroni corrected value,
- $573\ 00:29:10.260 --> 00:29:14.160$  but after testing for or adjusting for the four modules
- $574\ 00:29:14.160 \longrightarrow 00:29:18.330$  that we tested, we didn't see a significant association.
- $575~00{:}29{:}18.330 \dashrightarrow 00{:}29{:}21.990$  It is nice at least that the direction of effect
- $576\ 00:29:21.990 --> 00:29:23.040$  is what we would expect
- $577\ 00:29:23.040 --> 00:29:26.130$  based on our total brain volume association,
- $578\ 00:29:26.130 \longrightarrow 00:29:28.160$  which is that higher values of M2
- $579\ 00:29:31.290 --> 00:29:36.183$  correspond to sort of a lower incident dementia
- $580~00{:}29{:}38.460 \dashrightarrow 00{:}29{:}40.830$  The second module that we found to be associated
- $581\ 00:29:40.830 \longrightarrow 00:29:43.650$  with total brain volume was this M4,
- $582\ 00:29:43.650$  --> 00:29:46.950 which I will call sort of an inflammation-related module.
- 583 00:29:46.950 --> 00:29:48.843 It had 42 proteins in it.

- $584\ 00:29:49.680 \longrightarrow 00:29:52.200$  The highlighted pathway there
- 585 00:29:52.200 --> 00:29:54.630 was cytokine-cytokine receptor interactions,
- 586 00:29:54.630 --> 00:29:57.490 so these sort of immune signaling molecules,
- $587\ 00:29:57.490 \longrightarrow 00:30:00.030$  and in this case, the association
- $588\ 00:30:00.030 \longrightarrow 00:30:01.230$  was in the opposite direction
- $589\ 00:30:01.230$  --> 00:30:04.530 where higher values of this module for eigenprotein
- $590\ 00:30:04.530 \longrightarrow 00:30:06.570$  are associated with lower total brain volume.
- 591 00:30:06.570 --> 00:30:10.320 So it's sort of a risk conferring module
- $592\ 00:30:10.320 --> 00:30:13.706$  and, again, similar to what we saw here, not a significant,
- $593\ 00:30:13.706 \longrightarrow 00:30:17.077$  sort of an annoyingly borderline association
- $594~00{:}30{:}17.077 \dashrightarrow 00{:}30{:}20.310$  between this and dementia, but, again,
- $595\ 00:30:20.310 \longrightarrow 00:30:23.760$  the direction of effect is what we would expect
- 596~00:30:23.760 --> 00:30:27.273 based on our observed association with brain volume,
- $597\ 00:30:28.860 --> 00:30:31.290$  and, also, I'll just mention that I standardize
- 598 00:30:31.290 --> 00:30:33.900 the eigenprotein so that the effect sizes
- $599\ 00:30:33.900 \longrightarrow 00:30:36.810$  correspond to a standard deviation increase in eigenprotein.
- $600\ 00:30:36.810 --> 00:30:38.730$  So it's a little bit...
- 601 00:30:38.730 --> 00:30:40.440 One sort of drawback I would say
- $602\ 00:30:40.440 \longrightarrow 00:30:43.020$  of these methods is the interpretation
- $603\ 00:30:43.020 \longrightarrow 00:30:46.680$  since a standard deviation increase, in this case,
- $604\ 00:30:46.680 \longrightarrow 00:30:49.230$  depends entirely on the sample that you're using.
- $605\ 00:30:49.230 \longrightarrow 00:30:52.240$  So it's really just sort of a direction of effect
- $606\ 00:30:53.730 \longrightarrow 00:30:54.680$  more than anything.
- 607~00:30:56.460 --> 00:31:00.060 So to try and get at some of, get a better understanding
- $608\ 00:31:00.060 \longrightarrow 00:31:03.390$  of how these modules relate to our data
- $609\ 00:31:03.390 \longrightarrow 00:31:05.550$  or sort of what may be responsible

- $610\ 00:31:05.550 \longrightarrow 00:31:08.160$  for some of the associations we see,
- $611\ 00:31:08.160 \longrightarrow 00:31:11.610$  this is a map of the correlations
- $612\ 00:31:11.610 \longrightarrow 00:31:14.520$  between different demographic variables
- $613\ 00:31:14.520$  --> 00:31:17.520 and each of the modules, and I mentioned that we have
- $614\ 00:31:17.520 \longrightarrow 00:31:19.920$  a replication cohort as well, the CHS.
- 615 00:31:19.920 --> 00:31:23.100 So these two bars, sort of the two columns,
- $616\ 00:31:23.100 --> 00:31:26.553$  show the two different cohorts that were included.
- $617~00:31:27.510 \longrightarrow 00:31:31.350$  So I put blue arrows to show the covariates
- 618 00:31:31.350 --> 00:31:33.600 that were included in our regression model,
- $619\ 00{:}31{:}33.600 \dashrightarrow 00{:}31{:}35.490$  and you can see that there are some correlations
- 620 00:31:35.490 --> 00:31:37.994 between, say, sex and the modules,
- 621 00:31:37.994 --> 00:31:41.610 not really anything with APOE carrier status,
- 622 00:31:41.610 --> 00:31:44.130 maybe some education associations,
- $623\ 00:31:44.130 \longrightarrow 00:31:45.660$  and some associations with age.
- $624\ 00:31:45.660 \longrightarrow 00:31:49.290$  So it's good that we adjusted for those in our models.
- $625\ 00:31:49.290 \longrightarrow 00:31:52.740$  However, you can also see there are a lot of other factors,
- 626 00:31:52.740 --> 00:31:54.450 cardiovascular risk factors,
- 627 00:31:54.450 --> 00:31:58.020 such as systolic blood pressure, BMI,
- $628\ 00:31:58.020$  --> 00:32:01.770 fasting glucose that have associations with these modules.
- $629\ 00{:}32{:}01.770 \dashrightarrow 00{:}32{:}05.490$  So we wanted to see if any of those could perhaps explain
- $630\ 00:32:05.490 \longrightarrow 00:32:07.263$  the associations that we saw.
- 631 00:32:10.350 --> 00:32:13.740 So I'm repeating sort of our standard model here
- $632\ 00:32:13.740 \longrightarrow 00:32:16.203$  was what I showed results from previously.
- $633\ 00:32:17.040 \longrightarrow 00:32:18.840$  The expanded model that we considered
- 634 00:32:18.840 --> 00:32:21.213 included a bunch of these risk factors,

- $635\ 00:32:22.590 \longrightarrow 00:32:26.700$  basically, something representing BMI,
- $636\ 00:32:26.700$  --> 00:32:31.700 hypertension, sort of lipid dysregulation, and diabetes.
- 637 00:32:33.360 --> 00:32:35.643 and I also included smoking as well,
- $638\ 00:32:36.719 \longrightarrow 00:32:40.380$  and we also included a measure of kidney function,
- $639\ 00:32:40.380 --> 00:32:43.593$  which can also be an indicator of cardiovascular disease.
- $640\ 00:32:45.120 \longrightarrow 00:32:46.533$  So for module two,
- $641~00{:}32{:}47.520 \longrightarrow 00{:}32{:}50.400$  I'm repeating the sort of effects we saw
- $642\ 00:32:50.400 \longrightarrow 00:32:51.963$  from the standard model here,
- $643\ 00:32:52.950 \longrightarrow 00:32:55.650$  and when you adjust for the expanded set of covariates,
- 644 00:32:55.650 --> 00:32:58.320 your effect is attenuated by half,
- $645\ 00:32:58.320 \longrightarrow 00:33:01.170$  and it's no longer significantly associated.
- $646\ 00:33:01.170 \longrightarrow 00:33:04.320$  So with that says, it's either you have
- 647 00:33:04.320 --> 00:33:08.490 a sort of confounding issue
- $648\ 00{:}33{:}08.490 \dashrightarrow 00{:}33{:}12.300$  where the association you're seeing between these proteins
- $649\ 00:33:12.300 --> 00:33:15.660$  and total brain volume is really just in effect
- $650\ 00:33:15.660 --> 00:33:19.590$  of sort of poor cardiovascular health
- $651\ 00:33:19.590 --> 00:33:21.160$  or better cardiovascular health
- 652 00:33:22.230 --> 00:33:24.870 or you may think that it might be
- $653\ 00:33:24.870 \longrightarrow 00:33:26.370$  some sort of mediation effect
- $654\ 00:33:26.370 \longrightarrow 00:33:29.860$  where perhaps the risk associated
- $655\ 00{:}33{:}31.290 \dashrightarrow 00{:}33{:}34.470$  between the proteins and the sort of total brain volume
- $656\ 00:33:34.470 \longrightarrow 00:33:35.370$  could be mediated
- $657\ 00:33:35.370 \longrightarrow 00:33:39.813$  by some poor cardiovascular health outcomes,
- $658\ 00:33:41.430 \longrightarrow 00:33:43.080$  and then for module four,
- 659 00:33:43.080 --> 00:33:45.300 again, this sort of inflammation module,
- $660\ 00:33:45.300 \longrightarrow 00:33:48.120$  we don't see any real effect attenuation.
- $661\ 00:33:48.120 --> 00:33:49.410$  Regardless of whether you adjust

- 662 00:33:49.410 --> 00:33:51.540 for cardiovascular factors or not,
- $663\ 00:33:51.540 \longrightarrow 00:33:53.550$  it's still associated with total brain volume,
- $664\ 00:33:53.550 \longrightarrow 00:33:56.670$  which suggests it's sort of different mechanism
- $665\ 00:33:56.670 --> 00:33:58.721$  or lack of compounding between
- $666\ 00:33:58.721 \longrightarrow 00:34:01.293$  or based on cardiovascular health.
- $667\ 00:34:04.740 \longrightarrow 00:34:07.921$  Okay, so I mentioned
- 668 00:34:07.921 --> 00:34:11.550 in the sort of initial graphical abstract
- 669 00:34:11.550 --> 00:34:13.500 that once you find protein modules
- 670 00:34:13.500 --> 00:34:15.900 associated with your outcomes of interest,
- $671\ 00:34:15.900 \longrightarrow 00:34:18.990$  it can be good to look within the proteins of those modules
- $672\ 00:34:18.990 \longrightarrow 00:34:20.820$  to try and find sort of subsets
- $673\ 00{:}34{:}20.820 --> 00{:}34{:}25.530$  or specific proteins that may be driving the associations.
- $674\ 00:34:25.530 \longrightarrow 00:34:26.850$  So for modules two and four,
- $675\ 00{:}34{:}26.850 \dashrightarrow 00{:}34{:}29.939$  where we found associations with brain volume,
- $676\ 00{:}34{:}29.939 {\:{\mbox{--}}}{>}\ 00{:}34{:}34.180$  we wanted to see if we removed proteins one at a time
- 677 00:34:35.040 --> 00:34:37.020 based on their sort of increasing weight,
- $678\ 00:34:37.020$  --> 00:34:42.020 so remove the lowest weighted proteins in the modules first,
- $679\ 00:34:42.240 \longrightarrow 00:34:45.750$  what sort of happened to the strength of the associations.
- $680\ 00:34:45.750 --> 00:34:48.990$  So these are both associations with total brain volume.
- 681 00:34:48.990 --> 00:34:52.620 It's sort of the p-value on the y-axis,
- $682\ 00{:}34{:}52.620 \dashrightarrow 00{:}34{:}56.819$  and you can see that as you remove, say, from module two,
- $683\ 00:34:56.819 \longrightarrow 00:34:59.460$  the first 20 proteins or so,
- $684\ 00:34:59.460 --> 00:35:01.260$  you're really not seeing a difference
- $685\ 00{:}35{:}01.260 \dashrightarrow 00{:}35{:}05.280$  in the effect of the overall module with total brain volume,
- $686\ 00:35:05.280 --> 00:35:06.990$  which suggests that those proteins

- 687 00:35:06.990 --> 00:35:10.620 aren't really impacting the association,
- $688\ 00:35:10.620$  --> 00:35:15.420 whereas beyond that point, once you start removing proteins,
- $689\ 00:35:15.420 --> 00:35:17.400$  the association becomes less strong,
- 690 00:35:17.400 --> 00:35:20.190 and so that's suggesting that those proteins
- $691\ 00:35:20.190 \longrightarrow 00:35:24.720$  may have more of an impact on sort of the overall module,
- $692\ 00:35:24.720 --> 00:35:28.590$  and so for both of these modules, we identified the spot
- $693\ 00:35:28.590 \longrightarrow 00:35:31.650$  where sort of the based on the lowest p-value,
- $694\ 00:35:31.650 \longrightarrow 00:35:33.910$  which proteins were
- $695\ 00:35:35.190 --> 00:35:37.470$  sort of the most important in the module.
- 696 00:35:37.470 --> 00:35:40.830 I wanna emphasize that we didn't use this to...
- $697\ 00{:}35{:}40.830 \dashrightarrow 00{:}35{:}43.800$  So for things like dementia, if you were to run this,
- $698\ 00:35:43.800 \longrightarrow 00:35:46.590$  since we didn't see a strong association
- 699 00:35:46.590 --> 00:35:49.770 or a significant association beforehand,
- 700 00:35:49.770 --> 00:35:52.260 we didn't sort of use that to try and find a subset
- 701 00:35:52.260 --> 00:35:53.850 that we're significantly associated
- 702 00:35:53.850 --> 00:35:55.600 because I would call that cheating.
- $703~00{:}36{:}01.096 \dashrightarrow 00{:}36{:}05.010$  Okay, so the last piece that I'll talk about
- 704 00:36:05.010 --> 00:36:09.210 in terms of teasing apart associations
- $705\ 00:36:09.210$  --> 00:36:12.040 or sort of understanding protein within the modules
- $706\ 00:36:12.990 --> 00:36:15.780$  is this functional enrichment
- $707\ 00{:}36{:}15.780 {\: -->\:} 00{:}36{:}19.650$  or over-representation analysis within the modules.
- $708\ 00:36:19.650 \longrightarrow 00:36:24.360$  So based on the ones, sort of the significant modules
- $709\ 00:36:24.360 \longrightarrow 00:36:27.093$  or significantly associated modules with the outcomes,
- $710\ 00:36:28.080 --> 00:36:30.600$  there is this software called STRING

- 711 00:36:30.600 --> 00:36:35.310 that does a few different things, but what I used it for
- 712 00:36:35.310 --> 00:36:38.490 is doing an over-representation analysis
- 713 00:36:38.490 --> 00:36:41.070 of biological pathways.
- $714\ 00:36:41.070 \longrightarrow 00:36:45.090$  So the idea is that there are annotation databases
- $715\ 00:36:45.090 --> 00:36:48.360$  for proteins that sort of group them
- $716\ 00:36:48.360 \longrightarrow 00:36:50.670$  into biological functions
- 717 00:36:50.670 --> 00:36:52.830 or pathways that they're involved in,
- $718\ 00:36:52.830 \longrightarrow 00:36:55.170$  and the idea is that if you have a module
- $719\ 00:36:55.170 --> 00:36:57.660$  that has more proteins than you would expect
- $720\ 00:36:57.660 \longrightarrow 00:36:59.190$  from a given pathway,
- 721  $00:36:59.190 \longrightarrow 00:37:02.010$  then that's sort of the over-representation piece,
- 722 00:37:02.010 --> 00:37:04.770 and it indicates that that biological pathway
- 723 00:37:04.770 --> 00:37:07.620 might be important in whatever functions
- $724\ 00:37:07.620 \longrightarrow 00:37:09.423$  the module is carrying out.
- $725\ 00:37:12.030 \longrightarrow 00:37:15.728$  So this is just a screen grab of one example.
- $726\ 00:37:15.728 \longrightarrow 00:37:18.060$  So this is from module four.
- 727 00:37:18.060 --> 00:37:22.320 So you can see the annotation database is over on the left.
- $728\ 00:37:22.320 \longrightarrow 00:37:24.090$  So KEGG is one of them.
- 729 00:37:24.090 --> 00:37:26.190 Gene Ontology is another,
- $730\ 00:37:26.190 \longrightarrow 00:37:30.321$  and so you have these sort of observed proteins,
- 731 00:37:30.321  $\rightarrow$  00:37:33.210 and then the background is sort of the total number
- $732\ 00:37:33.210 \longrightarrow 00:37:35.550$  of proteins that are in the pathway,
- 733 00:37:35.550  $\rightarrow$  00:37:38.760 and the idea being that if you were to grab, I don't know.
- $734\ 00:37:38.760 \longrightarrow 00:37:41.250$  however many proteins out of the background,
- 735 00:37:41.250 --> 00:37:44.550 like how many would you expect to be in this module

 $736\ 00{:}37{:}44.550 \dashrightarrow 00{:}37{:}48.840$  due to chance, and do we have sort of over-representation

 $737\ 00:37:48.840 \longrightarrow 00:37:51.030$  compared to what we would expect?

 $738\ 00:37:51.030 \longrightarrow 00:37:52.440$  And so for module four,

 $739\ 00:37:52.440 \longrightarrow 00:37:54.930$  the cytokine-cytokine receptor interaction

740 00:37:54.930 --> 00:37:59.160 was the strongest overrepresented pathway,

741 00:37:59.160  $\rightarrow$  00:38:02.200 and then you can sort of look at these others that

 $742\ 00:38:03.240 \longrightarrow 00:38:07.770$  have some sort of false discovery rate greater than 0.05,

 $743\ 00:38:07.770 \longrightarrow 00:38:10.830$  and so I found the KEGG pathways, personally,

 $744\ 00:38:10.830 \longrightarrow 00:38:12.330$  to be the most informative.

745 00:38:12.330 --> 00:38:15.210 Gene Ontology tends to be a lot more specific,

 $746\ 00:38:15.210 --> 00:38:17.550$  which may be more useful for targeting

 $747\ 00:38:17.550 \longrightarrow 00:38:20.940$  certain sort of the apeutic processes

 $748\ 00:38:20.940 \longrightarrow 00:38:21.810$  or something like that,

 $749\ 00:38:21.810 \longrightarrow 00:38:24.840$  but so depending on the scale that is important to you,

750 00:38:24.840 --> 00:38:26.973 you can sort of use different annotations.

751 00:38:30.780 --> 00:38:33.360 Okay, so the last thing I wanted to talk about,

752 00:38:33.360 --> 00:38:35.703 with the Framingham data in particular,

753 00:38:37.530 --> 00:38:39.540 was sort of getting back to our motivation

 $754\ 00:38:39.540 --> 00:38:41.940$  for doing a network analysis in the first place.

755 00:38:42.780 --> 00:38:46.590 So the sort of contrast or comparator would be to do

 $756\ 00{:}38{:}46.590 \dashrightarrow 00{:}38{:}48.632$  individual protein analyses where you're running

 $757\ 00:38:48.632 \longrightarrow 00:38:52.530$  a regression model for each protein that you're analyzing,

 $758\ 00:38:52.530 \longrightarrow 00:38:55.192$  and so we did that as a point of comparison.

 $759~00:38:55.192 \dashrightarrow 00:38:59.310$  So for total brain volume, there were like a dozen proteins

 $760~00:38:59.310 \longrightarrow 00:39:01.950$  that were associated with total brain volume.

- 761 00:39:01.950 --> 00:39:04.080 One was associated with hippocampal volume,
- $762\ 00:39:04.080$  --> 00:39:07.230 and two were associated with Alzheimer's disease
- $763\ 00:39:07.230 \longrightarrow 00:39:09.843$  at an FDR value of less than 0.1.
- $764\ 00:39:11.400 \longrightarrow 00:39:14.130$  So what was interesting,
- $765\ 00:39:14.130 \longrightarrow 00:39:15.660$  especially with the brain volume results,
- $766\ 00:39:15.660 \longrightarrow 00:39:16.800$  and, again, that was where we had seen
- 767 00:39:16.800 --> 00:39:19.140 associations with these modules,
- 768 00:39:19.140 --> 00:39:22.950 some of the proteins that were significantly associated
- $769\ 00:39:22.950 \longrightarrow 00:39:27.933$  were from module two and module four and others weren't.
- 770  $00:39:28.860 \longrightarrow 00:39:31.770$  So what I get from that is a few things.
- $771\ 00:39:31.770 \longrightarrow 00:39:33.900$  One is that some proteins
- $772\ 00:39:33.900 \longrightarrow 00:39:35.940$  that are associated with the outcome
- 773 00:39:35.940 --> 00:39:38.820 are sort of individually associated
- $774\ 00:39:38.820 \longrightarrow 00:39:41.010$  but not sort of detectable
- $775\ 00:39:41.010 --> 00:39:43.860$  within sort of a larger network of proteins
- 776 00:39:43.860 --> 00:39:46.328 that are associated with that outcome,
- $777\ 00:39:46.328 \longrightarrow 00:39:48.390$  and then the other is that
- $778\ 00:39:48.390 \longrightarrow 00:39:51.042$  for those that are within the modules,
- 779 00:39:51.042 --> 00:39:52.800 we would only be getting information
- $780\ 00:39:52.800 \longrightarrow 00:39:55.710$  about sort of a few of the proteins in the modules,
- $781\ 00:39:55.710 \longrightarrow 00:39:58.893$  whereas, as we see here,
- $782\ 00{:}40{:}00.150 \dashrightarrow 00{:}40{:}03.450$  the associations tend or continue to get stronger
- $783\ 00:40:03.450 --> 00:40:05.670$  with sort of looking at the broader network
- $784\ 00:40:05.670 \longrightarrow 00:40:08.850$  around sort of the most highly weighted proteins.
- $785\ 00:40:08.850 --> 00:40:10.410$  So you're getting a bit more information
- $786\ 00:40:10.410 \longrightarrow 00:40:12.510$  about proteins that may be associated
- $787\ 00:40:12.510 \longrightarrow 00:40:14.010$  with total brain volume

 $788\ 00:40:14.010 \longrightarrow 00:40:16.950$  and maybe at some of the biological processes

 $789\ 00:40:16.950 \longrightarrow 00:40:19.950$  compared to if you're looking at things individually,

790 00:40:19.950 --> 00:40:21.900 but, again, because you're seeing associations

791 00:40:21.900 --> 00:40:23.280 that you don't catch with the modules,

792 00:40:23.280 --> 00:40:25.350 it's sort of important to look at both,

 $793\ 00:40:25.350 \longrightarrow 00:40:27.660$  and you get sort of complimentary information

794 00:40:27.660 --> 00:40:29.013 from the two approaches.

795 00:40:32.700  $\rightarrow$  00:40:34.383 So a caveat,

796 00:40:35.700 --> 00:40:36.960 I mentioned issues with lack

797 00:40:36.960 --> 00:40:39.870 with sort of difficulties in replication.

 $798\ 00:40:39.870 \longrightarrow 00:40:41.610$  We replicated this analysis

799 00:40:41.610 --> 00:40:44.310 in the Cardiovascular Health Study,

 $800\ 00:40:44.310 \longrightarrow 00:40:47.490$  and we did so by taking the same module,

 $801\ 00:40:47.490 \longrightarrow 00:40:49.530$  so module two and module four,

802 00:40:49.530 --> 00:40:52.080 taking the same weights from those proteins

 $803~00{:}40{:}52.080 \dashrightarrow 00{:}40{:}56.310$  and applying them to the protein concentrations

804 00:40:56.310 --> 00:40:59.490 in the Cardiovascular Health Study.

 $805~00{:}40{:}59.490 \dashrightarrow 00{:}41{:}02.010$  So we didn't do a network reconstruction or anything

 $806\ 00:41:02.010 \longrightarrow 00:41:03.480$  in the different study.

 $807\ 00:41:03.480 \longrightarrow 00:41:06.990$  We were just seeing if these modules replicated

 $808\ 00{:}41{:}06.990 \dashrightarrow 00{:}41{:}10.290$  in their associations with outcomes in a different cohort.

 $809\ 00:41:10.290 \longrightarrow 00:41:14.250$  So in this case, it's really not seeing much

 $810~00{:}41{:}14.250 \dashrightarrow 00{:}41{:}18.480$  in terms of association with both total brain volume

 $811\ 00:41:18.480 --> 00:41:21.810$  and we also looked at dementia out of interest

812 00:41:21.810 --> 00:41:26.430 since things were sort of close in our cohort,

 $813\ 00{:}41{:}26.430 \dashrightarrow 00{:}41{:}29.853$  but, really, we're not seeing much in terms of associations.

 $814\ 00:41:31.020 \longrightarrow 00:41:32.730$  Part of the reason for that,

- $815\ 00:41:32.730 \longrightarrow 00:41:35.670$  so there are not that many cohorts
- $816\ 00{:}41{:}35.670 {\:{\mbox{--}}\!>}\ 00{:}41{:}38.850$  that are available that have a large proteomic panel
- 817 00:41:38.850 --> 00:41:40.650 with the same proteins that we were looking at
- $818\ 00:41:40.650 \longrightarrow 00:41:44.670$  as well as MRI and incident dementia outcomes,
- $819\ 00{:}41{:}44.670 \dashrightarrow 00{:}41{:}47.700$  and, in this case, the demographics of the cohort
- $820\ 00{:}41{:}47.700 \dashrightarrow 00{:}41{:}50.520$  are fairly different from (in distinct) Framingham.
- $821\ 00:41:50.520 \longrightarrow 00:41:54.783$  So about 20 years older on average.
- 822 00:41:55.890 --> 00:41:57.930 I'm just including the sort of first few rows
- $823\ 00:41:57.930 \longrightarrow 00:42:00.810$  of our table one, but you can see differences in education,
- $824\ 00:42:00.810 \longrightarrow 00:42:03.180$  systolic blood pressure, and the same is true
- $825\ 00:42:03.180 \longrightarrow 00:42:05.940$  of a lot of the other cardiovascular risk factors.
- 826 00:42:05.940 --> 00:42:08.280 So it's a very different cohort,
- $827\ 00:42:08.280 \longrightarrow 00:42:10.320$  and digging a bit into the literature
- 828 00:42:10.320 --> 00:42:12.990 about sort of proteins over the life course,
- $829\ 00:42:12.990 \longrightarrow 00:42:15.510$  it's not too surprising that we don't see
- 830 00:42:15.510 --> 00:42:18.600 the same associations, but it it does sort of,
- 831 00:42:18.600 --> 00:42:20.070 it's a good cautionary message
- 832 00:42:20.070 --> 00:42:22.590 about drawing conclusions too far
- $833\ 00:42:22.590 \longrightarrow 00:42:24.600$  based on sort of one set of data
- $834\ 00:42:24.600 \longrightarrow 00:42:26.973$  or one set of demographics.
- $835\ 00:42:29.730 \longrightarrow 00:42:32.280$  Just to put these results in context,
- $836\ 00:42:32.280 \longrightarrow 00:42:35.580$  so our module four included
- $837\ 00:42:35.580 \longrightarrow 00:42:38.040$  a lot of immune-related signaling molecules
- 838 00:42:38.040 --> 00:42:41.430 like interleukins, TNF receptor proteins,
- $839\ 00{:}42{:}41.430 \dashrightarrow 00{:}42{:}44.490$  which are both types of cytokines, and have been associated
- 840 00:42:44.490 --> 00:42:47.310 with Alzheimer's disease previously,

841  $00:42:47.310 \longrightarrow 00:42:51.660$  in particular, interleukin-1 beta was in our module four,

842 00:42:51.660 --> 00:42:53.250 and it had been found to be elevated

 $843\ 00:42:53.250 \longrightarrow 00:42:56.070$  in 80 cases in a meta-analysis.

 $844\ 00:42:56.070$  --> 00:42:59.760 However, other biomarkers that have been sort of validated

 $845\ 00:42:59.760 \longrightarrow 00:43:04.427$  in other cohorts were not identified in our module.

846 00:43:07.590 --> 00:43:11.040 In module two, we saw Axon guidance pathway proteins

847 00:43:11.040 --> 00:43:13.470 including ephrins, netrins, and semaphorins,

 $848\ 00{:}43{:}13.470 \dashrightarrow 00{:}43{:}16.800$  which have been associated with AD in previous work,

 $849\ 00{:}43{:}16.800 \dashrightarrow 00{:}43{:}20.430$  and complement cascades are also have been associated

 $850\ 00:43:20.430 \longrightarrow 00:43:22.470$  with AD probably for the reason

 $851\ 00:43:22.470 \longrightarrow 00:43:26.810$  of inducing these immune cells called microglia

852 00:43:26.810 --> 00:43:29.980 in the brain to, basically, eat up

853 00:43:31.470 --> 00:43:35.100 cells in response to amyloid deposition.

 $854\ 00{:}43{:}35.100 \dashrightarrow 00{:}43{:}37.440$  So there's some biologically plausible mechanisms

 $855\ 00:43:37.440 \longrightarrow 00:43:40.030$  that could be associated with these modules

856 00:43:41.640 --> 00:43:43.683 in Alzheimer's disease,

 $857\ 00{:}43{:}46.080 \dashrightarrow 00{:}43{:}48.750$  and the last thing I'll say is talking about some sort

858 00:43:48.750 --> 00:43:50.790 of other ways of approaching this problem,

 $859\ 00:43:50.790 --> 00:43:53.910$  so as I mentioned, the CHS cohort

 $860\ 00:43:53.910 \longrightarrow 00:43:55.830$  has different underlying characteristics,

 $861~00{:}43{:}55.830 \dashrightarrow 00{:}43{:}58.950$  and so it may well have a different network structure.

 $862\ 00:43:58.950 \longrightarrow 00:44:02.130$  So one thing that could be good to do

 $863\ 00{:}44{:}02.130 \dashrightarrow 00{:}44{:}07.130$  is to look at sort of consensus modules across the cohorts

864 00:44:07.140 --> 00:44:09.240 where you construct networks in each cohort,

```
865\ 00:44:09.240 \longrightarrow 00:44:12.390 and then look at where the overlaps are,
```

866 00:44:12.390 --> 00:44:13.860 and you can get sort of a more,

867 00:44:13.860 --> 00:44:16.383 hopefully, more robust network across cohorts,

 $868\ 00:44:17.640 \longrightarrow 00:44:20.310$  and then there are other network-based approaches

 $869\ 00:44:20.310 \longrightarrow 00:44:22.290$  that can incorporate external information.

870 00:44:22.290 --> 00:44:24.060 So, again, our network approach

 $871\ 00:44:24.060 --> 00:44:27.450$  was just based on correlation in our dataset,

 $872\ 00{:}44{:}27.450 \dashrightarrow 00{:}44{:}32.450$  whereas other methods use sort of those annotation databases

 $873\ 00{:}44{:}32.670 \dashrightarrow 00{:}44{:}34.890$  and that sort of thing to construct the networks

 $874\ 00{:}44{:}34.890 \longrightarrow 00{:}44{:}39.090$  and sort of decide how strong the similarities between nodes

 $875\ 00:44:39.090 \longrightarrow 00:44:41.100$  or the strength of connections will be.

876 00:44:41.100 --> 00:44:42.450 So that's another approach,

877 00:44:43.290 --> 00:44:44.760 and then the last thing I'll say is that

878 00:44:44.760 --> 00:44:48.150 I'm sort of still using this kind of method

879 00:44:48.150 --> 00:44:51.270 now in work with longevity and aging

880 00:44:51.270 --> 00:44:53.940 and trying to apply it to metabolomics,

 $881\ 00:44:53.940 --> 00:44:58.940$  so metabolites data in cohorts related to those outcomes.

882 00:45:02.160 --> 00:45:03.720 So thank you all for being here.

883 00:45:03.720 --> 00:45:05.610 Thank you, my collaborators.

 $884\ 00:45:05.610 \longrightarrow 00:45:09.060$  This is the folks down at UT.

885  $00:45:09.060 \longrightarrow 00:45:10.637$  I'll say that (indistinct).

886 00:45:10.637 --> 00:45:11.470 Thank you.

887 00:45:16.170 --> 00:45:18.330 <-> Thank you for wonderful presentation.</r>

888  $00:45:18.330 \longrightarrow 00:45:19.500$  We're open for questions.

889 00:45:19.500 --> 00:45:21.300 So let's start with people in the room.

890 00:45:21.300 --> 00:45:22.710 Any questions?

- 891 00:45:22.710 --> 00:45:24.570 <v -> Got one over here.</v> <v -> Perfect, thank you.</v>
- 892 00:45:24.570 --> 00:45:26.220 <v Audience>Yeah, so my research interest</v>
- $893\ 00:45:26.220 \longrightarrow 00:45:28.200$  is about the cancer, and, also,
- $894\ 00:45:28.200 \longrightarrow 00:45:30.450$  we're interested in your study.
- 895 00:45:30.450  $\rightarrow$  00:45:34.920 So I've got some technical issues about this project.
- $896\ 00:45:34.920 \longrightarrow 00:45:36.480$  So the first issue that,
- $897\ 00{:}45{:}36.480 \dashrightarrow 00{:}45{:}41.070$  how do you do the normalization in your process?
- 898 00:45:41.070 --> 00:45:42.390 < v ->Yeah, great question.< / v >
- $899\ 00:45:42.390 \longrightarrow 00:45:44.160$  So yeah, I totally glossed over
- 900 00:45:44.160 --> 00:45:45.610 all the pre-processing stuff.
- 901 00:45:46.740 --> 00:45:51.090 So before doing the network construction,
- $902\ 00:45:51.090 \longrightarrow 00:45:53.970\ I$  log transformed the protein concentrations
- $903\ 00:45:53.970 \longrightarrow 00:45:55.920$  to reduce stiffness.
- 904 00:45:55.920 --> 00:45:57.720 There was a standardization within,
- $905\ 00:45:57.720 \longrightarrow 00:46:01.590$  there were sort of two phases of runs of protein modules,
- 906 00:46:01.590 --> 00:46:05.700 so I sort of standardized within those batches,
- $907~00{:}46{:}05.700 \dashrightarrow 00{:}46{:}10.700$  and then after that, I did a rank normalized
- $908~00{:}46{:}11.111 \dashrightarrow 00{:}46{:}15.663$  or inverse normal rank transformation to sort of-
- 909 00:46:15.663 --> 00:46:17.036 (audience speaks indistinctly)  $<\!\!\mathrm{v}$  ->What's that?</r>
- 910 00:46:17.036 --> 00:46:18.600 < v ->(indistinct) normalization?</v> < v->Basically.</v>
- 911 00:46:18.600 --> 00:46:20.040 Yeah, yeah, yeah.
- 912 00:46:20.040 --> 00:46:22.980 So that was sort of the data pre-processing.
- 913 00:46:22.980 --> 00:46:24.633 So I think I, you know,
- 914 00:46:25.800 --> 00:46:27.720 I've thought about sort of the pros and cons
- 915 00:46:27.720 --> 00:46:30.780 of those things as well and I think my biggest qualm

- 916 00:46:30.780  $\rightarrow$  00:46:34.350 with the way that I did it is sort of interpretability,
- 917 00:46:34.350 --> 00:46:37.110 because, yeah, sort of what does it mean
- $918\ 00:46:37.110 --> 00:46:38.790$  to be at one quantile versus another
- 919 00:46:38.790 --> 00:46:40.440 where you have this huge dynamic range
- 920 00:46:40.440 --> 00:46:42.330 of protein concentrations?
- 921 00:46:42.330 --> 00:46:44.100 <v Audience>So another question is that </v>
- 922 00:46:44.100 --> 00:46:46.230 I know that in your project,
- 923 00:46:46.230 --> 00:46:48.450 the modules identification is very important.
- 924 00:46:48.450 --> 00:46:50.883 So I wonder,
- $925\ 00:46:53.130 \longrightarrow 00:46:54.210$  you have talked a little bit
- 926 00:46:54.210 --> 00:46:56.600 about how to answer the modules,
- 927 00:46:56.600 --> 00:47:00.310 but so can you explain a little bit more
- 928 00:47:00.310 --> 00:47:05.223 about how you gonna bring modules from the data?
- 929 00:47:08.250 --> 00:47:10.590 <<br/>v -> I'm not sure, can you say a little bit more?<br/></v>
- 930 00:47:10.590 --> 00:47:13.110 <v Audience>Yeah, so in your previous pages,</v>
- 931 00:47:13.110 --> 00:47:16.980 I think you talked a little bit about the clustering
- 932 00:47:16.980 --> 00:47:18.283 of the modules so that we know
- 933  $00:47:18.283 \longrightarrow 00:47:21.750$  that there are four main modules.
- 934 00:47:21.750 --> 00:47:23.970 <v ->Yes.</v> <v ->In the whole dataset.</v>
- 935 00:47:23.970 --> 00:47:28.110 So what is the name of that algorithm
- 936 00:47:28.110 --> 00:47:30.712 and how it basically work?
- 937 00:47:30.712 --> 00:47:34.600 < v ->Yeah, so the clustering itself was done</v>
- 938 00:47:35.730 --> 00:47:40.530 using algorithm called H+.
- 939 00:47:40.530 --> 00:47:42.540 To be honest, I'm not too sure
- 940 00:47:42.540 --> 00:47:44.610 about sort of the details of it.

- 941 00:47:44.610 --> 00:47:47.563 It can use any dissimilarity measure,
- 942 00:47:47.563 --> 00:47:52.350 which, in our case, comes from the TOM matrix, but-
- 943 00:47:52.350 --> 00:47:55.140 <v Audience>So this is the algorithm that we separate</v>
- $944\ 00:47:55.140 \longrightarrow 00:47:58.123$  the whole proteins into four different modules
- $945\ 00:47:58.123 \longrightarrow 00:48:00.330$  so that we can analyze it one by one.
- 946 00:48:00.330 --> 00:48:01.440 <<br/>v ->Yeah, yeah, yeah, yeah.<br/></v> <v ->Yeah,<br/></v>
- $947\ 00:48:01.440 \longrightarrow 00:48:05.230$  so I also noticed that
- 948 00:48:07.290 --> 00:48:12.290 in the weighted protein expression network analysis,
- 949 00:48:13.320 --> 00:48:15.630 you talk about the beta values.
- 950 00:48:15.630 --> 00:48:17.560 < v ->Yes.</v> < v ->That you use that </v>
- 951 00:48:19.945 --> 00:48:22.705 like the soft threshold. < v -> Yeah. < / v >
- 952 00:48:22.705 --> 00:48:27.510 <v Audience>To make the genes to be more important</v>
- 953 00:48:27.510 --> 00:48:31.110 if that is the thing that you wanna analyze.
- 954 00:48:31.110 --> 00:48:35.220 So in this process, I want to know how you would make sure
- $955\ 00:48:35.220 \longrightarrow 00:48:39.053$  the value of the data in this process.
- 956 00:48:39.053 --> 00:48:41.927 <v -> So sorry, we have to end 'cause it's 12:15.</v>
- 957 00:48:41.927 --> 00:48:43.830 I know others have classes and everything.
- $958\ 00:48:43.830 \longrightarrow 00:48:45.568$  Maybe you guys can discuss a little bit.
- 960 00:48:47.580 --> 00:48:49.140 Please, if you're registered,
- 961 00:48:49.140 --> 00:48:51.330 make sure you signed in on a sign in sheet.
- $962\ 00:48:51.330 \longrightarrow 00:48:52.163$  There's three of 'em.
- 963 00:48:52.163 --> 00:48:53.640 You only have to sign on one of them,
- 964 00:48:53.640 --> 00:48:56.640 and then one-fourth page reflections will be due

965 00:48:56.640 --> 00:48:58.872 before the next speaker's time to speak. 966 00:48:58.872 --> 00:49:02.039 (indistinct talking)
