WEBVTT

 $00:00:00.060 \longrightarrow 00:00:03.500$ - Hi everyone, welcome to the sixth seminar

 $00:00:03.500 \longrightarrow 00:00:06.330$ of our seminar series on COVID-19

 $00:00:06.330 \longrightarrow 00:00:08.220$ organized by the Department of Biostatistics

 $00:00:08.220 \longrightarrow 00:00:10.490$ at Yale University.

 $00:00:10.490 \dashrightarrow 00:00:14.230$ I'm very pleased to have here today Nicholas Christakis.

 $00{:}00{:}14.230 --> 00{:}00{:}17.890$ He's a senior professor of social and medical science

 $00:00:19.320 \longrightarrow 00:00:21.130$ at Yale university.

 $00{:}00{:}21.130 \rightarrow 00{:}00{:}24.520$ He's very well know for his research on social networks

 $00{:}00{:}25.740 \dashrightarrow 00{:}00{:}30.740$ and his recent work focuses on how essentially human biology

 $00:00:31.470 \longrightarrow 00:00:36.370$ and health affect and are affected

 $00:00:36.370 \longrightarrow 00:00:39.200$ by social interaction, social networks.

 $00:00:39.200 \longrightarrow 00:00:41.580$ So today, he's gonna talk a little bit

 $00:00:41.580 \longrightarrow 00:00:45.130$ about the epidemiology of COVID-19.

00:00:45.130 --> 00:00:47.970 He's gonna give us an overview and updates

 $00:00:47.970 \longrightarrow 00:00:51.830$ and then he's gonna talk about his recent paper

00:00:51.830 --> 00:00:53.630 just published in Nature

 $00{:}00{:}53.630 --> 00{:}00{:}58.630$ on how to use mobility data and population overflow

 $00:00:58.820 \dashrightarrow 00:01:03.200$ from Wuhan to predict the spread of the COVID-19

 $00:01:03.200 \longrightarrow 00:01:04.820$ in all the areas of China.

 $00:01:04.820 \longrightarrow 00:01:08.260$ And then finally he's gonna talk about the new shining app

 $00:01:08.260 \longrightarrow 00:01:13.260$ called Hunala which is gonna use network science

 $00:01:14.370 \longrightarrow 00:01:18.200$ to essentially develop network sensors

 $00:01:18.200 \longrightarrow 00:01:20.393$ to four epidemic forecasting.

00:01:23.265 --> 00:01:26.400 So Nicholas is gonna take question anytime.

00:01:26.400 --> 00:01:29.800 So you're welcome to write questions in the chat box.

00:01:29.800 --> 00:01:34.180 And I will try to monitor it and read them to him.

 $00{:}01{:}34.180 \dashrightarrow 00{:}01{:}39.120$ Or you can just unmute yourself and ask questions any time.

 $00:01:39.120 \longrightarrow 00:01:40.500$ - Well raise your hands,

00:01:40.500 --> 00:01:43.270 I can monitor the participant list

 $00:01:43.270 \longrightarrow 00:01:45.560$ for raised hands electronically raised.

 $00:01:45.560 \longrightarrow 00:01:47.427$ That's easy for me.

00:01:47.427 --> 00:01:48.440 - All right.

00:01:48.440 --> 00:01:51.577 So Nicholas, thank you for participating

 $00:01:52.443 \longrightarrow 00:01:54.810$ and why don't you take it from here.

 $00:01:54.810 \longrightarrow 00:01:55.643$ - Thank you Laura.

 $00:01:55.643 \longrightarrow 00:01:56.940$ Thank you so much.

00:01:56.940 --> 00:01:58.850 I see many names that I recognize

 $00:01:58.850 \longrightarrow 00:02:00.693$ on this big panel in front of me.

00:02:01.660 --> 00:02:03.350 I'm gonna talk without slides

00:02:03.350 --> 00:02:05.020 because I find it very stressful

 $00:02:05.020 \longrightarrow 00:02:08.370$ and weird to use slides on Zoom.

00:02:08.370 --> 00:02:10.060 I find Zoom like probably many of you

00:02:10.060 --> 00:02:11.830 do pretty weird already.

00:02:11.830 --> 00:02:15.260 It's so disembodied and taxing in some ways.

00:02:15.260 --> 00:02:16.600 So I'm just gonna tell you a little bit

 $00:02:16.600 \longrightarrow 00:02:19.210$ about the epidemiology of Coronavirus

 $00:02:19.210 \dashrightarrow 00:02:22.450$ as it has come to be known by many people around the world

 $00:02:22.450 \dashrightarrow 00:02:26.450$ in the last few months since the epidemic started.

 $00:02:26.450 \longrightarrow 00:02:29.910$ And some of these things may be very simple or known to you,

00:02:29.910 --> 00:02:31.670 others will not be perhaps known to you,

 $00:02:31.670 \longrightarrow 00:02:34.130$ I hope I will tell you some things you don't know.

 $00:02:34.130 \longrightarrow 00:02:36.010$ And I'm happy to take questions at any time.

 $00:02:36.010 \longrightarrow 00:02:37.100$ And then towards the end,

 $00{:}02{:}37.100 \dashrightarrow 00{:}02{:}39.550$ I'm gonna tell you a little bit about some of the projects

 $00:02:39.550 \longrightarrow 00:02:41.760$ in my lab that have raised a number,

 $00{:}02{:}41.760 \dashrightarrow 00{:}02{:}44.980$ are raising a number of difficult statistical questions

 $00:02:44.980 \longrightarrow 00:02:46.270$ that we are absolutely eager

 $00:02:46.270 \longrightarrow 00:02:49.000$ to collaborate with people about.

 $00:02:49.000 \longrightarrow 00:02:51.710$ And Laura has been interacting with us now

 $00:02:51.710 \longrightarrow 00:02:53.090$ for quite a number of years

 $00:02:53.090 \longrightarrow 00:02:54.800$ as I've certain others of you

 $00:02:54.800 \longrightarrow 00:02:57.450$ that I can see on this list.

 $00:02:57.450 \longrightarrow 00:03:00.730$ So we are experiencing something very unusual

 $00:03:00.730 \longrightarrow 00:03:03.700$ in our species that happens from time to time,

 $00:03:03.700 \longrightarrow 00:03:06.680$ which is the introduction of a new pathogen.

 $00:03:06.680 \longrightarrow 00:03:08.830$ We happen to be alive at a moment

 $00:03:08.830 \longrightarrow 00:03:12.420$ when a new germ is entering our species

 $00:03:12.420 \longrightarrow 00:03:15.810$ and having what is known as an ecological release.

 $00:03:15.810 \longrightarrow 00:03:18.080$ It's just like when the rats were first introduced

 $00{:}03{:}18.080 \dashrightarrow 00{:}03{:}22.010$ to New Zealand, and they found you know, Terra Incognita,

 $00{:}03{:}22.010 \dashrightarrow 00{:}03{:}24.510$ and could just take over and do whatever they wanted.

00:03:24.510 --> 00:03:28.050 This virus spent decades evolving in barks,

 $00:03:28.050 \longrightarrow 00:03:30.200$ probably spent some time in pangolins

 $00:03:30.200 \longrightarrow 00:03:31.890$ that's still being worked out.

 $00:03:31.890 \longrightarrow 00:03:33.770$ And then in an unseen way,

 $00{:}03{:}33.770 \dashrightarrow 00{:}03{:}37.320$ almost surely in October or November in Wuhan China,

 $00{:}03{:}37.320 \dashrightarrow 00{:}03{:}41.450$ leapt into human beings and gradually spread among them

 $00:03:41.450 \longrightarrow 00:03:43.980$ and then spread around the world.

 $00:03:43.980 \longrightarrow 00:03:47.170$ This pathogen SARS-CoV-2

- $00:03:47.170 \longrightarrow 00:03:49.980$ bears a strong similarity to other pathogens
- $00:03:49.980 \longrightarrow 00:03:52.250$ that have been long circulating in bats.
- 00:03:52.250 --> 00:03:56.880 And it's the seventh such Coronavirus species
- $00:03:56.880 \longrightarrow 00:03:58.060$ that afflicts us.
- $00:03:58.060 \longrightarrow 00:04:01.250$ There are four species of Coronavirus
- $00:04:01.250 \longrightarrow 00:04:03.270$ that just cause the common cold,
- $00:04:03.270 \longrightarrow 00:04:06.190$ they cause about 20 or 30% of the common cold
- $00:04:06.190 \longrightarrow 00:04:07.400$ that people get.
- $00:04:07.400 \longrightarrow 00:04:09.210$ The other viruses that cause the common cold
- $00:04:09.210 \longrightarrow 00:04:11.170$ are other species of viruses.
- $00{:}04{:}11.170 --> 00{:}04{:}14.820$ And two of these Corona viruses also came from bats.
- 00:04:14.820 --> 00:04:18.390 In addition, there are two prior Coronavirus,
- $00:04:18.390 \longrightarrow 00:04:22.090$ a serious Corona viruses that have afflicted us,
- $00{:}04{:}22.090 \dashrightarrow 00{:}04{:}26.280$ what is the so called SARS-1 that was pandemic in 2003.
- 00:04:27.300 --> 00:04:30.090 It was a kind of limited pandemic, which I think,
- $00:04:30.090 \longrightarrow 00:04:33.100$ on the one hand, gave certain Asian countries
- $00:04:33.100 \longrightarrow 00:04:37.030$ a taste of what could happen so they prepared well.
- 00:04:37.030 --> 00:04:38.580 But on the other hand,
- $00:04:38.580 \longrightarrow 00:04:40.210$ because the pandemic petered out,
- 00:04:40.210 --> 00:04:42.090 it kind of lulled the rest of the world
- $00:04:42.090 \longrightarrow 00:04:44.210$ into a false sense of security.
- $00:04:44.210 \dashrightarrow 00:04:48.580$ And then the seventh, before the current SARS-CoV-2,
- $00{:}04{:}48.580 \dashrightarrow 00{:}04{:}50.040$ the seventh Corona virus
- $00{:}04{:}50.040 --> 00{:}04{:}52.810$ is something called Middle Eastern Respiratory Syndrome,
- $00:04:52.810 \longrightarrow 00:04:56.620$ or MERS, which is a virus that has a R naught
- $00:04:56.620 \longrightarrow 00:04:58.110$ which we'll talk about in a moment
- $00:04:58.110 \longrightarrow 00:05:00.010$ of less than one we think.

 $00:05:00.010 \longrightarrow 00:05:04.850$ Each infection yields about .9 new infections.

00:05:04.850 --> 00:05:07.240 So that epidemic self extinguishes,

 $00:05:07.240 \longrightarrow 00:05:08.200$ which is one reason

 $00{:}05{:}08.200 \dashrightarrow 00{:}05{:}13.200$ that MERS has not become as serious as SARS-2 has become.

00:05:13.830 --> 00:05:17.310 Anyway this SARS-CoV-2 leapt into humans

00:05:17.310 --> 00:05:21.740 sometime in November, started causing cases in December.

00:05:21.740 --> 00:05:23.300 And by the middle of January,

 $00{:}05{:}23.300 \dashrightarrow 00{:}05{:}27.560$ the Chinese knew that it was extremely serious.

 $00{:}05{:}27.560 \dashrightarrow 00{:}05{:}30.840$ I was contacted by some colleagues in China and Hong Kong

00:05:30.840 --> 00:05:33.420 on January 23 or 24th,

 $00{:}05{:}33.420 \dashrightarrow 00{:}05{:}35.870$ about the possibility of collaborating to do some work.

00:05:35.870 --> 00:05:37.950 We had been working for a long time,

 $00{:}05{:}37.950 \dashrightarrow 00{:}05{:}41.760$ using phone data from China to look at the impact of things

00:05:41.760 --> 00:05:46.250 like earthquakes on shaping people's social interactions,

 $00:05:46.250 \longrightarrow 00:05:48.970$ or the building of high speed rail lines.

 $00{:}05{:}48.970 \dashrightarrow 00{:}05{:}50.860$ So we had a well established collaboration

 $00:05:50.860 \longrightarrow 00:05:53.620$ and well established procedures for handling data.

 $00:05:53.620 \longrightarrow 00:05:54.870$ And they contacted me

 $00:05:54.870 \longrightarrow 00:05:57.660$ and we decided to study the impact

00:05:57.660 --> 00:05:59.710 or something to do with phone data

 $00:05:59.710 \longrightarrow 00:06:01.393$ and the pandemic.

 $00:06:02.250 \longrightarrow 00:06:06.870$ And so we began working in earnest on the 24th of January,

 $00:06:06.870 \longrightarrow 00:06:07.910$ and all the one 58,

00:06:07.910 --> 00:06:10.000 it reminded me of when I was a graduate student,

 $00:06:10.000 \longrightarrow 00:06:12.570$ because we worked non stop for three weeks,

 $00:06:12.570 \longrightarrow 00:06:13.860$ it was very exciting.

 $00{:}06{:}13.860 \dashrightarrow 00{:}06{:}15.500$ And of course, because they were on the other side

 $00:06:15.500 \longrightarrow 00:06:16.650$ of the world, you know,

 $00{:}06{:}16.650 \dashrightarrow 00{:}06{:}18.670$ I would work during the day and then hand it to them,

 $00:06:18.670 \longrightarrow 00:06:19.503$ and then they wake up

 $00:06:19.503 \longrightarrow 00:06:22.100$ and they work during their day while I slept.

 $00:06:22.100 \longrightarrow 00:06:23.620$ And then it would come back to me.

 $00{:}06{:}23.620 \dashrightarrow 00{:}06{:}26.180$ When we submitted the paper on February the 18th,

 $00:06:26.180 \longrightarrow 00:06:29.441$ and it was ultimately published two months later

 $00:06:29.441 \longrightarrow 00:06:30.620$ in the middle of April.

 $00:06:30.620 \longrightarrow 00:06:32.450$ That's the paper that Laura mentioned.

 $00{:}06{:}32.450 \dashrightarrow 00{:}06{:}35.470$ And in this paper, what we did is is we had phone data

 $00:06:35.470 \longrightarrow 00:06:38.710$ on 11 and a half million transits through Wuhan.

 $00{:}06{:}38.710 \dashrightarrow 00{:}06{:}42.470$ We could track people as they transited through Wuhan

 $00:06:42.470 \longrightarrow 00:06:45.830$ and spread out around the country.

 $00:06:45.830 \longrightarrow 00:06:48.680$ And we had the misfortune as a species,

 $00:06:48.680 \longrightarrow 00:06:52.560$ that this epidemic left to us at a moment in time

 $00:06:52.560 \longrightarrow 00:06:55.993$ and in a place where the one of the largest I think,

 $00:06:57.330 \longrightarrow 00:06:59.040$ annual human migration takes place.

 $00:06:59.040 \dashrightarrow 00:07:04.040$ During that annual Harvest Moon Festival in China,

 $00:07:04.374 \longrightarrow 00:07:06.459$ the new year festival.

 $00:07:06.459 \longrightarrow 00:07:11.230$ So there are 3 billion translocations of people

 $00:07:11.230 \longrightarrow 00:07:14.650$ that take place in China in the run up to this holiday,

 $00:07:14.650 \longrightarrow 00:07:17.453$ which was on January 24th or 25th this year.

 $00:07:18.519 \longrightarrow 00:07:21.670$ So the virus steps into us at a time

00:07:21.670 --> 00:07:23.400 when people are spreading out,

 $00:07:23.400 \longrightarrow 00:07:26.090$ and millions of Chinese moved throughout the country,

 $00:07:26.090 \longrightarrow 00:07:28.090$ including transiting through Wuhan.

 $00{:}07{:}28.090 \dashrightarrow 00{:}07{:}31.020$ And unbeknownst to them, they carry the virus with them.

 $00:07:31.020 \longrightarrow 00:07:32.260$ And what we were able to do

 $00:07:32.260 \longrightarrow 00:07:35.480$ is using simply the movement of people,

 $00{:}07{:}35.480 \dashrightarrow 00{:}07{:}37.960$ track with phone data, the aggregate number of people

 $00{:}07{:}37.960 \dashrightarrow 00{:}07{:}42.190$ that left Wuhan between January 1st and January 24th,

 $00{:}07{:}42.190 \dashrightarrow 00{:}07{:}46.120$ and spread out to the other 296 prefectures of China.

00:07:46.120 --> 00:07:48.540 By tracking the number of people who left

 $00:07:48.540 \longrightarrow 00:07:50.130$ and carry the germ with them,

 $00:07:50.130 \longrightarrow 00:07:52.100$ we were able to build a model that allowed us

 $00:07:52.100 \longrightarrow 00:07:54.680$ to predict the timing, intensity

 $00:07:54.680 \dashrightarrow > 00:07:59.680$ and location of the epidemic up through late February.

 $00:08:00.100 \longrightarrow 00:08:01.530$ And this model we believe,

00:08:01.530 --> 00:08:03.300 and I'll return to a little bit later,

 $00:08:03.300 \longrightarrow 00:08:05.710$ this model we believe could be useful

 $00:08:05.710 \longrightarrow 00:08:07.700$ in other sorts of situations

 $00:08:07.700 \longrightarrow 00:08:11.270$ in which there is a risk source or risk sources

 $00:08:11.270 \longrightarrow 00:08:15.770$ that one is trying to assess in terms of its impact

00:08:15.770 --> 00:08:17.950 on this spreading of an epidemic,

 $00:08:17.950 \longrightarrow 00:08:19.650$ especially if there's data available.

 $00{:}08{:}19.650 \dashrightarrow 00{:}08{:}21.413$ And I'll come back to that later.

00:08:23.530 --> 00:08:25.860 So of course, these people in China in Wuhan,

 $00:08:25.860 \longrightarrow 00:08:28.060$ then of course spread out throughout the world.

 $00:08:28.060 \longrightarrow 00:08:31.220$ The Chinese were criticized for closing

 $00:08:31.220 \longrightarrow 00:08:36.210$ their internal borders by January the 25th,

 $00:08:36.210 \longrightarrow 00:08:39.200$ the Chinese had imposed stay at home orders

- $00:08:39.200 \longrightarrow 00:08:41.410$ on prefectures in China,
- $00:08:41.410 \longrightarrow 00:08:44.823$ that encompassed past 930 million people.
- 00:08:45.890 --> 00:08:49.590 So beginning on January 25, nearly a billion people
- $00:08:49.590 \longrightarrow 00:08:52.150$ were under some form of home isolation.
- 00:08:52.150 --> 00:08:54.300 And this really got my attention,
- $00:08:54.300 \longrightarrow 00:08:56.040$ because the Chinese had judged
- 00:08:56.040 --> 00:08:58.343 that in order to combat this pathogen,
- $00:08:58.343 \longrightarrow 00:09:00.230$ that the enemy that they were facing
- $00:09:00.230 \dashrightarrow 00:09:03.950$ and the virus required them to basically detonate
- $00:09:03.950 \longrightarrow 00:09:05.840$ a social nuclear weapon.
- $00:09:05.840 \longrightarrow 00:09:08.830$ This was how strong they rightly in my view
- $00:09:08.830 \longrightarrow 00:09:12.480$ felt that the epidemic was.
- 00:09:12.480 --> 00:09:14.500 So they close down their own country,
- 00:09:14.500 --> 00:09:17.080 but they lagged a little in closing down travel
- $00:09:17.080 \longrightarrow 00:09:18.540$ and leaving Wuhan.
- $00:09:18.540 \longrightarrow 00:09:20.160$ Some people have have said
- $00:09:20.160 \longrightarrow 00:09:22.050$ that there was some conspiracy to do that.
- $00:09:22.050 \longrightarrow 00:09:23.540$ I see no evidence of that.
- $00:09:23.540 \longrightarrow 00:09:26.140$ I just think they were scrambling to cope with a pandemic,
- 00:09:26.140 --> 00:09:27.930 they closed internal travel
- $00:09:27.930 \dashrightarrow 00:09:31.650$ but didn't close external travel till a week or so later.
- 00:09:31.650 --> 00:09:34.040 And without of course the germ you know,
- $00:09:34.040 \longrightarrow 00:09:35.200$ spread around the world.
- 00:09:35.200 --> 00:09:37.810 Although it would have spread no matter what.
- $00:09:37.810 \longrightarrow 00:09:40.250$ It's in the nature of these pathogens
- $00:09:40.250 \longrightarrow 00:09:41.700$ once they take root.
- $00:09:41.700 \longrightarrow 00:09:43.260$ There's really no stopping them
- $00:09:44.560 \longrightarrow 00:09:46.663$ as I alluded to earlier.
- $00:09:49.050 \longrightarrow 00:09:52.120$ So the Chinese quarantined Wuhan

- $00:09:52.120 \longrightarrow 00:09:54.150$ and then Hubei province surrounded home
- $00:09:54.150 \longrightarrow 00:09:57.723$ to 58 million people on January the 24th.
- 00:09:58.870 --> 00:10:01.860 Now, the first paper about this pathogen,
- $00:10:01.860 \longrightarrow 00:10:03.610$ regarding the first 41 cases
- 00:10:03.610 --> 00:10:06.290 appeared in The Lancet on the same date
- $00:10:06.290 \longrightarrow 00:10:08.827$ around January the 24th.
- $00:10:08.827 \dashrightarrow 00:10:11.600$ And that very first paper noted the extreme likelihood
- 00:10:11.600 -> 00:10:15.440 of interpersonal spread and the severity of the infection.
- $00:10:15.440 \longrightarrow 00:10:18.030$ So the nature of what we were confronting
- $00:10:18.030 \longrightarrow 00:10:23.030$ was well understood by scientists early in January.
- $00:10:23.060 \longrightarrow 00:10:26.640$ I don't think we can claim that we had no idea
- $00:10:26.640 \longrightarrow 00:10:28.410$ there was interpersonal spread,
- $00:10:28.410 \longrightarrow 00:10:29.730$ or that it was serious.
- $00:10:29.730 \longrightarrow 00:10:33.610$ And the virus we now know from genetic studies
- $00{:}10{:}33.610 \dashrightarrow 00{:}10{:}36.980$ arrived in Seattle already by the middle of January.
- $00:10:36.980 \longrightarrow 00:10:39.027$ And this is one of the reasons that border closures
- $00:10:39.027 \longrightarrow 00:10:42.030$ are so ineffective as other scientists
- $00{:}10{:}42.030 \dashrightarrow 00{:}10{:}46.050$ including Neil Ferguson's group, and Mark Lipschitz's group
- $00:10:46.050 \longrightarrow 00:10:47.550$ have also looked at
- $00:10:47.550 \longrightarrow 00:10:50.780$ is that by the time you're aware of what's happening,
- $00:10:50.780 \longrightarrow 00:10:53.560$ and you try to close the borders, it's too late.
- $00{:}10{:}53.560 \rightarrow 00{:}10{:}57.360$ The pathogen has spread, you know, surreptitiously
- $00:10:57.360 \longrightarrow 00:10:58.820$ and cross the borders.
- 00:10:58.820 --> 00:11:00.530 And in fact, it had arrived in Seattle
- 00:11:00.530 --> 00:11:02.170 by the middle of January,
- $00{:}11{:}02.170 \dashrightarrow 00{:}11{:}07.170$ and via Italy, in New York City by the middle of February.

- 00:11:07.210 --> 00:11:10.030 And by then, after that point,
- $00:11:10.030 \dashrightarrow 00:11:13.480$ most of the cases throughout the rest of the United States
- $00:11:13.480 \longrightarrow 00:11:16.810$ actually were seated from internal cases.
- $00:11:16.810 \longrightarrow 00:11:19.660$ And eventually, community transmission took over
- 00:11:19.660 --> 00:11:23.210 at importation, whether from a broad or from other states
- 00:11:23.210 --> 00:11:26.350 became a progressively tinier fraction of the size
- $00:11:26.350 \longrightarrow 00:11:28.580$ of operates at any particular location.
- $00{:}11{:}28.580 \dashrightarrow 00{:}11{:}32.710$ This is, again, typical of what happens with epidemics.
- 00:11:32.710 --> 00:11:35.880 You know, some cases move in, epidemic starts,
- $00:11:35.880 \longrightarrow 00:11:37.100$ and then it just takes off
- $00:11:37.100 \longrightarrow 00:11:38.520$ and it's not doesn't matter
- $00:11:38.520 \longrightarrow 00:11:41.793$ how many more people come in to a location.
- $00:11:44.086 \longrightarrow 00:11:46.010$ And of course, it's spread into other countries
- $00:11:46.010 \longrightarrow 00:11:48.150$ around the world as well.
- 00:11:48.150 --> 00:11:49.280 Now right from the beginning,
- $00:11:49.280 \longrightarrow 00:11:50.920$ there was a lot of effort
- 00:11:50.920 --> 00:11:54.270 to estimate key epidemiological parameters
- $00:11:54.270 \longrightarrow 00:11:55.230$ about this pathogen.
- $00{:}11{:}55.230 \dashrightarrow 00{:}11{:}58.340$ And I suspect everyone in this group knows about this.
- 00:11:58.340 --> 00:12:00.450 but I'll just review quickly what's known,
- $00:12:00.450 \longrightarrow 00:12:02.460$ and then highlight one other interesting parameter
- $00:12:02.460 \longrightarrow 00:12:05.370$ that not as many people pay attention on
- $00:12:05.370 \longrightarrow 00:12:08.120$ but I know this group will be interested in.
- 00:12:08.120 --> 00:12:11.490 So the so called R naught, the R0
- $00:12:11.490 \longrightarrow 00:12:13.110$ is the number of new cases
- $00:12:13.110 \longrightarrow 00:12:16.110$ in a fully susceptible non-immune
- $00:12:16.110 \longrightarrow 00:12:19.540$ normally interacting, typical population.
- $00:12:19.540 \longrightarrow 00:12:21.660$ That's an attempt to measure something intrinsic

- $00:12:21.660 \dashrightarrow 00:12:26.150$ about the virus in a kind of typical human population
- $00:12:26.150 \longrightarrow 00:12:27.350$ where no one is immune,
- $00:12:27.350 \longrightarrow 00:12:29.870$ the virus is brand new to us,
- 00:12:29.870 --> 00:12:31.290 people are interacting normally,
- $00:12:31.290 \longrightarrow 00:12:34.400$ we haven't yet taken any protective action.
- $00:12:34.400 \longrightarrow 00:12:36.557$ So this is known as the R naught.
- 00:12:36.557 --> 00:12:39.460 And for this germ, for SARS-CoV-2,
- 00:12:39.460 --> 00:12:42.020 it's probably around two and a half,
- $00:12:42.020 \longrightarrow 00:12:44.680$ and it could be as high as three.
- $00:12:44.680 \longrightarrow 00:12:47.230$ This is high, actually.
- 00:12:47.230 --> 00:12:51.010 The seasonal flu has an R naught of about 1.3 to 1.6.
- $00:12:52.900 \longrightarrow 00:12:56.460$ Chickenpox has an R naught of 3.5 to 6.
- $00:12:56.460 \longrightarrow 00:12:58.813$ Ebola has an R naught of 1.5 to 1.9.
- $00:13:00.815 \longrightarrow 00:13:04.260$ And of course the champion pathogen is measles,
- 00:13:04.260 --> 00:13:06.490 which has an R naught of 18,
- 00:13:06.490 --> 00:13:09.390 which is why vaccination rates for measles
- $00:13:09.390 \longrightarrow 00:13:10.950$ have to be so high,
- $00:13:10.950 \longrightarrow 00:13:12.670$ because the pathogen is so infectious,
- $00{:}13{:}12.670 \dashrightarrow 00{:}13{:}15.637$ there's a relationship between the amount of the pathogen
- 00:13:15.637 --> 00:13:19.480 and the required vaccination rate to stop it,
- $00:13:19.480 \longrightarrow 00:13:22.560$ before you could get herd immunity for example.
- $00:13:22.560 \longrightarrow 00:13:24.280$ Now, the so called Re, R sub e
- $00:13:26.170 \longrightarrow 00:13:28.490$ is the effective reproductive rate.
- $00{:}13{:}28.490 \dashrightarrow 00{:}13{:}32.120$ This is the number of new cases as the epidemic proceeds,
- $00:13:32.120 \longrightarrow 00:13:35.890$ and as immunity rises, or as people take action.
- 00:13:35.890 --> 00:13:38.370 And this number can fall and change.
- $00:13:38.370 \longrightarrow 00:13:41.590$ So for example, if we all of a sudden became hermits.

- 00:13:41.590 --> 00:13:43.770 nobody interacted with anyone else,
- $00:13:43.770 \longrightarrow 00:13:46.110$ the Re would fall below one.
- $00:13:46.110 \longrightarrow 00:13:48.140$ This is actually what happened to China.
- $00:13:48.140 \longrightarrow 00:13:49.667$ They were able to track the Re
- 00:13:49.667 --> 00:13:51.640 and find that whereas it started
- 00:13:51.640 --> 00:13:54.050 at around 3 in Wuhan in January.
- 00:13:54.050 --> 00:13:55.640 After their national lockdowns,
- $00:13:55.640 \longrightarrow 00:13:57.960$ it fell to about 0.3,
- 00:13:57.960 --> 00:14:02.260 each new case only created a third of a new case.
- $00:14:02.260 \longrightarrow 00:14:05.700$ So that's, you know, when the epidemic extinguishes.
- $00:14:05.700 \longrightarrow 00:14:09.630$ So this Re is very sensitive to the natural rise
- $00:14:09.630 \longrightarrow 00:14:11.650$ of immune people in the population,
- $00:14:11.650 \longrightarrow 00:14:13.460$ and also the human behaviors
- $00:14:13.460 \longrightarrow 00:14:18.450$ or ultimately for lucky vaccination that we might implement.
- $00:14:18.450 \longrightarrow 00:14:20.470$ But there's another very important parameter
- 00:14:20.470 --> 00:14:21.930 that I think will interest this group
- $00:14:21.930 \longrightarrow 00:14:24.820$ and that many that perhaps not all of you have heard about,
- $00:14:24.820 \longrightarrow 00:14:27.120$ which is the variance in the R naught,
- $00:14:27.120 \longrightarrow 00:14:28.420$ or the variance in the Re.
- $00:14:29.570 \longrightarrow 00:14:31.330$ And there was a landmark paper
- 00:14:31.330 --> 00:14:32.960 that was published by Lloyd Smith
- 00:14:32.960 --> 00:14:35.890 and his colleagues in Nature in 2005,
- $00:14:35.890 \longrightarrow 00:14:38.570$ that quantify this using a dispersion parameter
- $00:14:38.570 \longrightarrow 00:14:40.320$ they called Kappa,
- $00{:}14{:}40.320 \dashrightarrow 00{:}14{:}44.260$ which seeks to quantify the interindividual variation
- $00:14:44.260 \longrightarrow 00:14:48.470$ in the R, in the reproductive rate of the pathogen.
- $00:14:48.470 \longrightarrow 00:14:52.080$ So imagine a situation where,
- $00:14:52.080 \longrightarrow 00:14:55.360$ for everyone, every single person in the population,

- 00:14:55.360 --> 00:14:59.440 the R is two, each person infects two other people,
- $00{:}14{:}59.440 \dashrightarrow 00{:}15{:}01.760$ and another situation in which it is zero
- 00:15:01.760 --> 00:15:04.940 for many people, but let's say 50 for one person,
- $00:15:04.940 \longrightarrow 00:15:08.370$ imagine the population, a small population.
- $00{:}15{:}08.370 \dashrightarrow 00{:}15{:}12.003$ The average R in these two situations could be the same.
- $00:15:13.460 \longrightarrow 00:15:16.730$ But the ability of the epidemic to establish itself
- 00:15:16.730 --> 00:15:18.710 actually could be quite different,
- $00:15:18.710 \longrightarrow 00:15:21.630$ and would be much easier in the former case.
- $00{:}15{:}21.630 \dashrightarrow 00{:}15{:}26.480$ In the latter case, you have more super spreading events.
- $00:15:26.480 \longrightarrow 00:15:27.750$ There's a variance in the R
- 00:15:27.750 --> 00:15:30.200 so you've got that right tail distribution,
- $00:15:30.200 \longrightarrow 00:15:32.557$ some situations where one person might infect 50
- $00:15:32.557 \longrightarrow 00:15:36.030$ or 100 people, but also most of the cases
- $00:15:36.030 \longrightarrow 00:15:39.030$ are dead ends, most people infect no one.
- $00:15:39.030 \longrightarrow 00:15:41.280$ So in a population of such people infected
- $00:15:41.280 \longrightarrow 00:15:42.430$ with such a germ,
- $00:15:42.430 \longrightarrow 00:15:45.070$ if one person leaves and goes somewhere else,
- $00{:}15{:}45.070 \dashrightarrow 00{:}15{:}47.710$ most of the time they won't be able to establish an epidemic
- $00:15:47.710 \longrightarrow 00:15:49.500$ in the new location.
- $00{:}15{:}49.500 \dashrightarrow 00{:}15{:}52.110$ So the random movement of people from one population
- $00:15:52.110 \longrightarrow 00:15:54.760$ to another, from a risks source to another place
- $00{:}15{:}54.760 \dashrightarrow 00{:}15{:}57.840$ won't be able to establish an epidemic.
- $00{:}15{:}57.840 \dashrightarrow 00{:}16{:}01.530$ So this dispersion parameter is actually quite important
- 00:16:01.530 --> 00:16:04.837 for what might happen in these types of a situation.
- $00:16:04.837 \dashrightarrow 00:16:09.700$ And it turns out that the dispersion parameter for SARS-2,
- $00:16:09.700 \longrightarrow 00:16:11.330$ what we're currently facing

- $00:16:11.330 \longrightarrow 00:16:14.130$ is smaller, the variance is smaller
- $00:16:14.130 \longrightarrow 00:16:16.960$ than the variance was for SARS-1.
- 00:16:16.960 --> 00:16:18.540 And this actually is one of the things
- $00:16:18.540 \longrightarrow 00:16:21.010$ that's making SARS-2 worse for us.
- $00:16:21.010 \longrightarrow 00:16:24.130$ Even though there are super spreading events now,
- $00:16:24.130 \longrightarrow 00:16:27.730$ they are fewer than they were for the previous pathogen.
- $00:16:27.730 \longrightarrow 00:16:31.050$ And more often now, a move of a person
- $00:16:31.050 \longrightarrow 00:16:34.110$ from one place to another starts the epidemic
- $00:16:34.110 \longrightarrow 00:16:36.373$ and can result in it taking off.
- $00{:}16{:}37.720 {\:{\circ}{\circ}{\circ}}>00{:}16{:}40.410$ Now, superspreading depends not only on the pathogen,
- $00:16:40.410 \longrightarrow 00:16:42.360$ but also of course on the host,
- $00{:}16{:}42.360 \dashrightarrow 00{:}16{:}45.880$ attributes of the host that are immunity to the pathogen,
- 00:16:45.880 --> 00:16:47.700 how irritable like some people,
- 00:16:47.700 --> 00:16:50.160 let's say my cough more than other people,
- $00:16:50.160 \longrightarrow 00:16:51.710$ so that might make me more likely
- $00:16:51.710 \longrightarrow 00:16:54.570$ to be a super spreader than you.
- $00{:}16{:}54.570 \dashrightarrow 00{:}16{:}56.820$ Super-spreading events also have to do with the environment.
- 00:16:56.820 --> 00:17:00.840 This is why a pact conferences of people
- $00:17:00.840 \longrightarrow 00:17:03.720$ are more likely to cause super spreading events,
- $00:17:03.720 \longrightarrow 00:17:07.383$ then open air concerts and so forth.
- 00:17:08.470 --> 00:17:11.130 So people try quickly to get a sense
- $00:17:11.130 \longrightarrow 00:17:13.280$ of the reproductive rate of this pathogen
- $00:17:13.280 \longrightarrow 00:17:14.630$ and they were successful.
- $00{:}17{:}14.630 \dashrightarrow 00{:}17{:}17.220$ There have been like dozens of studies now quantifying this
- $00:17:17.220 \longrightarrow 00:17:18.590$ and the summary statistic
- $00:17:18.590 \longrightarrow 00:17:20.840$ is around two and a half that I told you.
- $00:17:20.840 \longrightarrow 00:17:22.890$ And also the dispersion parameter

- $00:17:22.890 \longrightarrow 00:17:24.113$ they tried to quantify.
- 00:17:24.970 --> 00:17:28.140 Distinctly, people tried to quantify the case fatality rate
- $00:17:28.140 \longrightarrow 00:17:31.200$ or the infection fatality rate of this parameter.
- 00:17:31.200 --> 00:17:34.030 And there's still ongoing of this pathogen
- $00:17:34.030 \longrightarrow 00:17:36.992$ and there's still ongoing debate about the CFR
- $00:17:36.992 \longrightarrow 00:17:37.825$ and the IFR.
- $00{:}17{:}38.920 \dashrightarrow 00{:}17{:}43.630$ The CFR is the fraction of people who die conditional
- 00:17:43.630 --> 00:17:46.170 on their coming to medical attention,
- $00:17:46.170 \longrightarrow 00:17:48.740$ or a little bit better definition,
- $00:17:48.740 \longrightarrow 00:17:51.680$ conditional on their developing symptoms,
- 00:17:51.680 --> 00:17:53.950 something which is called the S-CFR,
- $00:17:53.950 \longrightarrow 00:17:56.550$ the symptomatic case fatality ratio.
- $00:17:56.550 \dashrightarrow 00:18:01.460$ And we think this number is about between 0.5 and 1% still.
- $00:18:01.460 \longrightarrow 00:18:03.393$ It could be as low as 0.3%.
- $00:18:04.630 \longrightarrow 00:18:06.403$ But I doubt that it's any lower.
- 00:18:07.460 --> 00:18:09.330 And notice that the case fatality rate
- 00:18:09.330 --> 00:18:12.310 is very sensitive to people's behavior.
- $00:18:12.310 \longrightarrow 00:18:14.330$ You know, do people seek medical care?
- $00{:}18{:}14.330 \dashrightarrow 00{:}18{:}16.280$ You know, if they have mild symptoms from the disease.
- $00:18:16.280 \longrightarrow 00:18:17.780$ they might never tell anybody.
- $00{:}18{:}18.640 \dashrightarrow 00{:}18{:}21.290$ Or it's sensitive to the ability of the health care system
- $00:18:21.290 \longrightarrow 00:18:22.660$ to save their lives.
- $00:18:22.660 \longrightarrow 00:18:25.560$ So this is not something that's sort of written in stone,
- $00:18:25.560 \longrightarrow 00:18:27.100$ but it's something that attempts
- 00:18:27.100 --> 00:18:29.960 to quantify how lethal a pathogen is it
- $00:18:29.960 \longrightarrow 00:18:31.313$ that we have on our hands.

- $00:18:32.330 \dashrightarrow 00:18:36.860$ The case fatality rate for the seasonal flu is about 0.1%.
- $00:18:36.860 \longrightarrow 00:18:39.060$ So on average, about one out of 1000 people
- 00:18:39.060 --> 00:18:41.390 who get seasonal flu will die,
- 00:18:41.390 --> 00:18:44.680 and SARS-2, the current pathogen we're facing
- $00:18:44.680 \longrightarrow 00:18:47.150$ is less deadly than SARS-1.
- $00:18:47.150 \longrightarrow 00:18:51.260$ The case fatality rate for SARS-1 was about 10%.
- $00:18:51.260 \longrightarrow 00:18:52.860$ Yeah, was about 10%.
- 00:18:52.860 --> 00:18:55.990 So it's about about 10 times as deadly
- $00:18:55.990 \longrightarrow 00:18:57.860$ as the current pathogen.
- $00:18:57.860 \longrightarrow 00:19:00.160$ And similarly the case fatality rate
- 00:19:00.160 --> 00:19:03.190 for the 1918 flu pandemic,
- $00:19:03.190 \longrightarrow 00:19:06.223$ which was very bad, was about 4 to 5%.
- $00:19:07.310 \longrightarrow 00:19:09.350$ Now, one of the things that's interesting about this,
- $00:19:09.350 \longrightarrow 00:19:10.420$ as many of you may know
- $00:19:10.420 \longrightarrow 00:19:15.170$ is that actually a less fatal disease is more difficult
- $00:19:15.170 \longrightarrow 00:19:19.620$ to treat, to stop,
- $00:19:19.620 \longrightarrow 00:19:22.240$ because when the disease kills us rapidly
- $00:19:22.240 \longrightarrow 00:19:24.650$ like Ebola, the victim dies
- $00:19:24.650 \longrightarrow 00:19:28.290$ before they can transmit the disease.
- $00:19:28.290 \longrightarrow 00:19:29.623$ But if the disease's less deadly,
- $00:19:29.623 \longrightarrow 00:19:31.760$ and the person is walking around
- $00:19:31.760 \longrightarrow 00:19:33.010$ for a longer period of time,
- 00:19:33.010 --> 00:19:36.163 while sick, they can infect more people.
- $00:19:37.130 \longrightarrow 00:19:39.490$ So this this difference between SARS-2,
- 00:19:39.490 --> 00:19:42.740 what we're facing and SARS-2 in 2003,
- $00:19:42.740 \dashrightarrow 00:19:45.480$ I should have mentioned that the SARS-1 petered out
- $00:19:45.480 \longrightarrow 00:19:48.477$ there were only eight and a half thousand cases worldwide.
- $00:19:48.477 \longrightarrow 00:19:51.130$ You know, it was a trivial pandemic

- $00:19:51.130 \longrightarrow 00:19:52.863$ compared to what we're facing now.
- $00:19:53.900 \longrightarrow 00:19:56.560$ So and I forgot how many deaths but it was in,
- $00:19:56.560 \longrightarrow 00:20:00.030$ you know, I think 500 or six 700 deaths
- $00:20:00.030 \longrightarrow 00:20:02.023$ from the SARS-1 pandemic.
- 00:20:03.130 --> 00:20:05.760 So the lower the fatality of this pandemic,
- 00:20:05.760 --> 00:20:08.680 ironically makes it more dangerous,
- $00:20:08.680 \longrightarrow 00:20:11.180$ lower the fatality on a per case basis,
- $00:20:11.180 \longrightarrow 00:20:12.450$ because it can spread farther
- $00:20:12.450 \longrightarrow 00:20:14.967$ and ultimately cause many deaths.
- $00{:}20{:}14.967 \dashrightarrow 00{:}20{:}17.930$ And in general, it's an evolutionary biology principle
- $00:20:17.930 \longrightarrow 00:20:20.860$ that the pathogens don't want to kill us.
- $00:20:20.860 \longrightarrow 00:20:24.040$ That is to say, pathogens do better
- $00:20:24.040 \longrightarrow 00:20:27.020$ when they're not as deadly because they can spread.
- $00:20:27.020 \longrightarrow 00:20:30.120$ And also variants of the pathogen
- 00:20:30.120 --> 00:20:33.070 that don't kill us or don't kill us fast,
- 00:20:33.070 --> 00:20:36.473 typically outstrip variants that do kill us fast.
- $00:20:38.056 \longrightarrow 00:20:40.350$ So that's one of the reasons in general
- $00:20:40.350 \longrightarrow 00:20:43.060$ we tend to see the evolution of pathogens
- $00{:}20{:}43.060 \longrightarrow 00{:}20{:}46.010$ to be less severe as time goes by.
- 00:20:46.010 --> 00:20:48.913 And I'll come back to this point as well in just a moment.
- 00:20:52.001 --> 00:20:54.580 And then the infection fatality rate
- 00:20:54.580 --> 00:20:57.200 as distinct from the case fatality rate,
- $00:20:57.200 \longrightarrow 00:21:01.500$ is the fraction of people who get infected and die.
- $00{:}21{:}01.500 \dashrightarrow 00{:}21{:}04.020$ Not the ones that come to medical attention.
- $00:21:04.020 \longrightarrow 00:21:08.010$ So we think that about 50% or develop symptoms,
- $00:21:08.010 \longrightarrow 00:21:10.200$ we think that about 50% of people
- 00:21:10.200 --> 00:21:12.830 who get SARS-2 are asymptomatic.
- $00:21:12.830 \longrightarrow 00:21:15.200$ And so this means that in this case,
- $00:21:15.200 \longrightarrow 00:21:17.600$ because of that 50% number,

 $00:21:17.600 \longrightarrow 00:21:22.240$ it means that the IFR is about half the CFR in this case.

00:21:22.240 --> 00:21:26.460 So, half the people that get infected,

00:21:26.460 --> 00:21:28.220 don't get any symptoms at all.

 $00:21:28.220 \longrightarrow 00:21:30.330$ And so this makes the IFR lower

 $00:21:30.330 \longrightarrow 00:21:32.743$ by a factor of two than the CFR.

00:21:33.870 --> 00:21:35.510 Now you can take these two parameters,

00:21:35.510 --> 00:21:38.960 the reproductive rate and the case fatality rate,

 $00:21:38.960 \longrightarrow 00:21:40.900$ and you can put them on a little graph

 $00:21:40.900 \longrightarrow 00:21:43.850$ and then you can plot all of the pandemics

 $00:21:43.850 \longrightarrow 00:21:46.680$ that have occurred, let's say in the last hundred years,

 $00:21:46.680 \longrightarrow 00:21:50.920$ this is a typical exercise that epidemiologists engage in.

00:21:50.920 --> 00:21:54.840 And if you do that, you find very distressingly

 $00:21:54.840 \longrightarrow 00:21:56.850$ that the SARS-2 pandemic

 $00:21:56.850 \longrightarrow 00:22:01.820$ falls between the 1957 influenza A pandemic,

 $00:22:01.820 \longrightarrow 00:22:04.470$ which was the second deadliest pandemic

 $00:22:04.470 \longrightarrow 00:22:06.760$ we've had in the last hundred years.

 $00:22:06.760 \longrightarrow 00:22:10.100$ And the 1918 pandemic, which is the deadliest.

 $00:22:10.100 \longrightarrow 00:22:13.500$ So, this is a serious pathogen SARS-CoV-2.

 $00{:}22{:}13.500 \dashrightarrow 00{:}22{:}17.300$ It's right there in between the upper right corner is 1918.

 $00:22:17.300 \longrightarrow 00:22:18.680$ it's not as bad as that,

 $00:22:18.680 \longrightarrow 00:22:20.757$ but it's worse than 1957

 $00:22:22.130 \longrightarrow 00:22:25.063$ when you look at these two numerical parameters.

 $00{:}22{:}26.430 \dashrightarrow 00{:}22{:}29.630$ And in fact, it was clear to many people in certainly

00:22:29.630 --> 00:22:32.270 by February, that without action,

 $00:22:32.270 \longrightarrow 00:22:34.170$ many people would die.

 $00{:}22{:}34.170 \dashrightarrow 00{:}22{:}36.950$ I think hundreds of thousands of Americans would have died,

 $00:22:36.950 \longrightarrow 00:22:38.410$ had we done nothing.

```
00:22:38.410 --> 00:22:39.800 And unfortunately, I still think
```

 $00:22:39.800 \longrightarrow 00:22:41.560$ that hundreds of thousands will die.

00:22:41.560 --> 00:22:43.850 We've already had 100,000 deaths,

 $00{:}22{:}43.850 \dashrightarrow 00{:}22{:}47.010$ I think we're gonna very likely have at least another couple

 $00:22:47.010 \longrightarrow 00:22:48.510$ of hundred thousand deaths

 $00:22:48.510 \longrightarrow 00:22:52.290$ before the epidemic ultimately winds down

 $00:22:52.290 \longrightarrow 00:22:54.540$ in two or three years.

 $00:22:54.540 \longrightarrow 00:22:55.990$ And this partly relates to the fact

00:22:55.990 --> 00:22:57.570 that we're gonna have more waves,

 $00:22:57.570 \longrightarrow 00:22:59.320$ which is a point I'll come back to.

 $00{:}23{:}00.470 \dashrightarrow 00{:}23{:}04.250$ The disease itself has very wide range of presentations,

 $00:23:04.250 \longrightarrow 00:23:07.240$ from asymptomatic to mild to critical

00:23:07.240 --> 00:23:09.110 and can affect many organ systems,

00:23:09.110 --> 00:23:11.480 not just the upper airway or the lungs,

 $00:23:11.480 \longrightarrow 00:23:14.160$ but also the heart and the kidneys

 $00:23:15.875 \longrightarrow 00:23:18.290$ and the intestinal system and so forth.

00:23:18.290 --> 00:23:21.060 And the symptomatology is very protein as well.

00:23:21.060 --> 00:23:22.477 People manifest a great variety of symptoms.

 $00{:}23{:}22.477 \dashrightarrow 00{:}23{:}24.990$ There are three clusters of symptoms,

 $00{:}23{:}24.990 --> 00{:}23{:}28.080$ most are respiratory cough, shortness of breath, fever.

 $00:23:28.080 \longrightarrow 00:23:31.930$ Some are the musculoskeletal system, fatigue,

00:23:31.930 --> 00:23:34.060 muscle pains, joint pains.

00:23:34.060 --> 00:23:36.830 And some are intera, diarrhea, vomiting,

 $00:23:36.830 \longrightarrow 00:23:39.453$ nausea, and again, maybe a fever.

00:23:41.740 --> 00:23:44.820 The case fatality rate for this respiratory,

 $00:23:44.820 \longrightarrow 00:23:46.890$ for respiratory diseases in general

 $00:23:46.890 \longrightarrow 00:23:49.500$ typically varies with age.

 $00:23:49.500 \longrightarrow 00:23:54.060$ And most most of the respiratory pandemics

 $00:23:54.060 \longrightarrow 00:23:57.060$ of the last century have had a U-shaped function.

- $00:23:57.060 \longrightarrow 00:23:59.580$ So the very young and the very old
- $00:23:59.580 \longrightarrow 00:24:01.373$ are at the greatest risk of death.
- 00:24:02.510 --> 00:24:07.020 Famously, in 1918, there was a W-shaped function.
- 00:24:07.020 --> 00:24:08.300 There's some interesting theories
- 00:24:08.300 --> 00:24:09.610 if we have time and you're interested,
- $00:24:09.610 \longrightarrow 00:24:11.540$ I can tell you what some other scientists
- $00{:}24{:}11.540 \dashrightarrow 00{:}24{:}14.840$ have speculated as to why it was a W, the very young,
- 00:24:14.840 --> 00:24:17.403 very old were killed and middle aged,
- $00{:}24{:}18.330 \dashrightarrow 00{:}24{:}22.563$ sort of working age young adults, 20s and 30s were killed.
- 00:24:23.710 --> 00:24:25.430 And then finally, there's an L-shaped
- $00:24:25.430 \longrightarrow 00:24:27.580$ or backward L-shaped curve.
- $00:24:27.580 \longrightarrow 00:24:30.530$ So polio has a regular L-shape curve.
- 00:24:30.530 --> 00:24:32.960 So polio pandemics, they kill the young
- $00:24:32.960 \longrightarrow 00:24:34.870$ and they sort of spare the old.
- 00:24:34.870 --> 00:24:38.190 But Coronavirus has a backward L-shaped,
- $00:24:38.190 \longrightarrow 00:24:40.850$ it spares the young and kills the old
- $00:24:40.850 \longrightarrow 00:24:42.640$ and this is unusual,
- 00:24:42.640 --> 00:24:44.833 very unusual actually for a pathogen,
- $00:24:46.420 \longrightarrow 00:24:48.240$ and the fatality rate rises
- $00{:}24{:}48.240 \dashrightarrow 00{:}24{:}52.000$ from about one out of 3000 people younger than 20.
- $00:24:52.000 \longrightarrow 00:24:54.860$ The case fatality rate so conditional on getting sick,
- $00:24:54.860 \longrightarrow 00:24:57.030$ one out of 3000 people will die
- $00:24:57.030 \longrightarrow 00:24:58.780$ to about one out of 100 for people
- $00:24:58.780 \longrightarrow 00:25:01.030$ in their late 50s, early 60s
- $00:25:01.030 \longrightarrow 00:25:05.010$ to about one out of five for people who are older than 80.
- $00{:}25{:}05.010 \dashrightarrow 00{:}25{:}08.593$ So pretty sharp L-shaped curve.
- 00:25:09.820 --> 00:25:12.193 And I found it very poignant,

- $00:25:13.340 \longrightarrow 00:25:14.830$ almost biblical actually
- $00:25:14.830 \longrightarrow 00:25:18.510$ and sweet that this epidemic spared the young
- 00:25:18.510 --> 00:25:20.040 because, you know, the young,
- 00:25:20.040 --> 00:25:23.390 the leading killer of young children is infectious disease,
- $00:25:23.390 \longrightarrow 00:25:25.480$ something like 60% of kids
- $00:25:25.480 \longrightarrow 00:25:28.773$ under five worldwide die of infections.
- $00:25:30.040 \longrightarrow 00:25:32.660$ And the fact that this virus spared them
- $00:25:32.660 \longrightarrow 00:25:34.423$ was very pleasing to me.
- 00:25:35.410 --> 00:25:38.530 And moving actually, and as a parent,
- $00:25:38.530 \longrightarrow 00:25:40.760$ I didn't have to worry about my college age kids
- $00:25:40.760 \longrightarrow 00:25:42.900$ or we have a new child but Eric
- 00:25:42.900 --> 00:25:44.150 and I do that's 10 years old,
- $00:25:44.150 \longrightarrow 00:25:47.253$ and so we didn't have to worry about him, which was helpful.
- 00:25:48.520 --> 00:25:50.520 Now, another important part of the epidemiology
- $00:25:50.520 \longrightarrow 00:25:51.830$ of this condition is something known
- $00:25:51.830 \longrightarrow 00:25:53.720$ as the incubation period.
- $00{:}25{:}53.720 \to 00{:}25{:}58.720$ In cubation period is the time between being infected
- $00:25:58.900 \longrightarrow 00:26:00.850$ and developing symptoms.
- $00:26:00.850 \longrightarrow 00:26:03.910$ And that is between two and 24 days,
- 00:26:03.910 --> 00:26:06.730 I'm sorry, two and 14 days,
- $00{:}26{:}06.730 \dashrightarrow 00{:}26{:}09.720$ the incubation period varies between two and 14 days,
- $00:26:09.720 \longrightarrow 00:26:13.040$ more precise estimates of this have shown recently
- $00{:}26{:}13.040 \dashrightarrow 00{:}26{:}18.040$ and people are studying this a lot, that 97.5% of people,
- 00:26:19.120 --> 00:26:21.130 if they're going to get symptoms,
- $00{:}26{:}21.130 \dashrightarrow 00{:}26{:}24.693$ after being infected, get them by 11 and a half days.
- 00:26:25.600 --> 00:26:27.810 So, people are still studying the details of this,
- $00:26:27.810 \longrightarrow 00:26:29.860$ but the gist is that early on,

```
00:26:29.860 \longrightarrow 00:26:33.460 it was established that 95% of cases got symptoms
```

- $00:26:33.460 \longrightarrow 00:26:35.640$ within the first 14 days of infection.
- $00:26:35.640 \longrightarrow 00:26:39.000$ And this is the origin of the 14 day quarantine
- $00:26:39.000 \longrightarrow 00:26:41.740$ that we have all been practicing.
- $00{:}26{:}41.740 \dashrightarrow 00{:}26{:}45.510$ There's a different quantity known as the latency period.
- $00:26:45.510 \longrightarrow 00:26:48.150$ This is the time from infection to infectiousness,
- 00:26:48.150 --> 00:26:49.670 how long between when you're infected
- $00:26:49.670 \longrightarrow 00:26:54.270$ and can infect others and very sadly for us
- 00:26:54.270 --> 00:26:59.270 in this pathogen, unlike SARS-1 in 2003,
- $00:26:59.560 \longrightarrow 00:27:01.860$ this latency period can be a couple of days
- $00:27:01.860 \longrightarrow 00:27:05.140$ shorter than the incubation period.
- $00:27:05.140 \longrightarrow 00:27:08.290$ That means that people can spread the infection
- $00:27:08.290 \longrightarrow 00:27:10.420$ when they're asymptomatic.
- 00:27:10.420 --> 00:27:12.380 And many estimates from China and Italy
- $00:27:12.380 \longrightarrow 00:27:15.520$ and England suggest that the majority of cases,
- $00{:}27{:}15.520 \dashrightarrow 00{:}27{:}18.883$ the bare majority maybe or sometimes the great majority,
- $00:27:20.170 \longrightarrow 00:27:23.105$ arise from this type of transmission.
- $00:27:23.105 \longrightarrow 00:27:26.340$ So most people become infected from other people
- $00:27:26.340 \longrightarrow 00:27:28.880$ who don't have symptoms let's say.
- $00:27:28.880 \longrightarrow 00:27:30.330$ The difference between these two
- $00:27:30.330 \longrightarrow 00:27:32.810$ is known as the mismatch period.
- 00:27:32.810 --> 00:27:34.110 Actually, in veterinary medicine,
- 00:27:34.110 --> 00:27:35.280 there's some veterinary scientists
- $00:27:35.280 \longrightarrow 00:27:37.150$ that call it the Omega period,
- 00:27:37.150 --> 00:27:39.240 which I think is kind of interesting
- $00:27:39.240 \longrightarrow 00:27:41.490$ when you think about the implications for us.
- $00:27:43.910 \longrightarrow 00:27:47.060$ In some cases, the latency period
- $00:27:47.060 \longrightarrow 00:27:49.510$ is shorter than the incubation period,
- $00:27:49.510 \longrightarrow 00:27:51.563$ for example, like in HIV.

```
00:27:52.731 \longrightarrow 00:27:55.630 So people with HIV can be infectious for years
```

- $00:27:55.630 \longrightarrow 00:27:57.590$ before they have symptoms,
- 00:27:57.590 --> 00:28:00.510 that makes the disease difficult to control,
- $00:28:00.510 \longrightarrow 00:28:03.190$ or the latency period can be equal to
- $00{:}28{:}03.190 \dashrightarrow 00{:}28{:}07.520$ or longer than the incubation period, like small-pox.
- $00:28:07.520 \longrightarrow 00:28:09.620$ You have to get smallpox vesicles
- $00:28:09.620 \longrightarrow 00:28:12.120$ on your body before you can infect other people.
- $00:28:12.120 \longrightarrow 00:28:14.620$ So we can see who's infected.
- $00:28:14.620 \longrightarrow 00:28:17.527$ And that makes quarantine so much easier
- $00:28:17.527 \longrightarrow 00:28:19.123$ and so much effective.
- $00{:}28{:}20.780 --> 00{:}28{:}23.820$ So the fact that there is a negative mismatch period,
- $00:28:23.820 \longrightarrow 00:28:25.530$ that is to say that the latency is shorter
- $00:28:25.530 \longrightarrow 00:28:27.490$ than the intubation on average.
- 00:28:27.490 --> 00:28:29.510 And this condition is one of the things
- $00:28:29.510 \longrightarrow 00:28:32.973$ that makes it so nasty and difficult to treat.
- $00:28:33.960 \longrightarrow 00:28:35.610$ In terms of transmission modes,
- 00:28:35.610 --> 00:28:37.360 there's a lot of ongoing research on this,
- $00:28:37.360 \longrightarrow 00:28:39.800$ it's clear that the primary mode
- $00:28:39.800 \longrightarrow 00:28:43.650$ is through respiratory droplets, people coughing,
- 00:28:43.650 --> 00:28:46.530 or speaking loudly or singing.
- $00{:}28{:}46.530 \dashrightarrow 00{:}28{:}48.210$ There have been a number of super spreading operates
- $00:28:48.210 \longrightarrow 00:28:50.683$ associated with singing or yelling.
- $00:28:52.480 \longrightarrow 00:28:53.560$ But there's also evidence
- $00{:}28{:}53.560 \dashrightarrow 00{:}28{:}55.070$ that there's airborne transmission
- $00:28:55.070 \longrightarrow 00:28:57.360$ which is small little parts of droplets
- 00:28:57.360 --> 00:28:58.890 come out of your mouth and fall down,
- 00:28:58.890 --> 00:29:01.400 which is why wearing a mask is effective.
- $00:29:01.400 \longrightarrow 00:29:03.670$ Airborne droplets can stay suspended
- $00:29:03.670 \longrightarrow 00:29:05.540$ in the air and spread farther.

```
00:29:05.540 \longrightarrow 00:29:07.400 There is airborne transmission.
```

- $00:29:07.400 \longrightarrow 00:29:09.560$ But it's not so bad.
- $00:29:09.560 \longrightarrow 00:29:11.850$ We don't think in this condition.
- 00:29:11.850 --> 00:29:13.290 Although well, I won't go into it.
- $00:29:13.290 \longrightarrow 00:29:14.640$ There's some examples.
- $00:29:14.640 \longrightarrow 00:29:16.510$ There's also spread by fomites,
- $00:29:16.510 \longrightarrow 00:29:18.940$ that's surfaces that we touch.
- $00:29:18.940 \longrightarrow 00:29:21.430$ Although this is increasingly not seen
- $00:29:21.430 \longrightarrow 00:29:23.800$ as a major vehicle for transmission,
- $00:29:23.800 \longrightarrow 00:29:25.480$ there's also fecal transmission
- $00:29:25.480 \longrightarrow 00:29:28.270$ although again, this is not a major explanation
- $00:29:28.270 \longrightarrow 00:29:30.120$ for what's happening in the epidemic.
- 00:29:31.010 --> 00:29:35.520 Now, how do humans respond to epidemics?
- 00:29:35.520 --> 00:29:39.450 Well, the broad division is pharmaceutical interventions,
- $00:29:39.450 \longrightarrow 00:29:42.270$ and so called non-pharmaceutical interventions.
- $00:29:42.270 \longrightarrow 00:29:44.200$ We don't have any pharmaceutical interventions
- $00:29:44.200 \longrightarrow 00:29:45.360$ really for this pathogen.
- $00:29:45.360 \longrightarrow 00:29:46.630$ We have no vaccines for it,
- $00:29:46.630 \longrightarrow 00:29:47.810$ although we're working on it.
- $00:29:47.810 \longrightarrow 00:29:50.570$ We have no drugs, although Remdesivir
- $00:29:50.570 \longrightarrow 00:29:53.480$ has recently been felt to have some benefit
- 00:29:53.480 --> 00:29:55.760 it's modest benefit and we don't have drugs,
- $00:29:55.760 \longrightarrow 00:29:57.410$ and in general viruses are very difficult
- $00:29:57.410 \longrightarrow 00:29:59.870$ to treat, antiviral medications generally
- $00:29:59.870 \longrightarrow 00:30:02.760$ are weak in their effectiveness.
- $00:30:02.760 \longrightarrow 00:30:07.760$ So, just like plague is an ancient threat to human beings,
- $00:30:09.440 \longrightarrow 00:30:11.900$ we have to respond to a familiar enemy
- $00:30:11.900 \longrightarrow 00:30:14.520$ with a familiar response,
- 00:30:14.520 --> 00:30:16.610 which is physical distancing.

```
00:30:16.610 --> 00:30:18.710 People have been physical distancing
```

- $00:30:18.710 \longrightarrow 00:30:21.240$ in times of plague for centuries.
- $00:30:21.240 \longrightarrow 00:30:24.440$ And unfortunately, that's what we have to do.
- 00:30:24.440 --> 00:30:28.720 We have to engage in a non-pharmaceutical interventions.
- $00:30:28.720 \longrightarrow 00:30:29.770$ There are two broad kinds
- 00:30:29.770 --> 00:30:31.870 of non-pharmaceutical interventions,
- $00:30:31.870 \longrightarrow 00:30:35.820$ individual interventions, things like hand washing,
- 00:30:35.820 --> 00:30:39.590 or mask wearing, or self-isolation
- $00:30:39.590 \longrightarrow 00:30:41.050$ and collective interventions
- $00:30:41.050 \longrightarrow 00:30:43.680$ that required the action of groups of people
- $00:30:43.680 \longrightarrow 00:30:47.930$ or the state, border closures, collective hygiene,
- 00:30:47.930 --> 00:30:50.240 you know, cleaning the subways for example,
- 00:30:50.240 --> 00:30:53.820 testing and tracing, bans on gatherings,
- $00:30:53.820 \dashrightarrow 00:30:58.820$ school closures, and ultimately stay at home orders.
- $00:30:58.940 \longrightarrow 00:31:00.590$ And these two classes,
- $00:31:00.590 \longrightarrow 00:31:02.390$ these non-pharmaceutical interventions
- $00:31:02.390 \longrightarrow 00:31:06.020$ can be divided into individual and collective,
- $00:31:06.020 \longrightarrow 00:31:08.560$ but they can be divided in a different way
- $00:31:08.560 \longrightarrow 00:31:11.730$ in what are known as transmission reduction
- $00:31:11.730 \longrightarrow 00:31:13.580$ and contact reduction.
- $00:31:13.580 \longrightarrow 00:31:15.300$ So transmission reduction are things
- 00:31:15.300 --> 00:31:17.120 that try to reduce the likelihood
- 00:31:17.120 --> 00:31:18.920 that conditional on my interacting
- $00:31:18.920 \longrightarrow 00:31:20.360$ with you, I give you the germ.
- 00:31:20.360 --> 00:31:22.300 So wearing a mask or washing my hands
- $00:31:22.300 \longrightarrow 00:31:24.250$ or sanitation measures
- $00:31:24.250 \longrightarrow 00:31:27.530$ might be transmission reduction measures.
- $00:31:27.530 \longrightarrow 00:31:31.320$ But contact reduction or condom use
- $00{:}31{:}31{:}320 \dashrightarrow 00{:}31{:}35{.}150$ in the case of HIV is a transmission reduction intervention.

 $00:31:35.150 \longrightarrow 00:31:36.750$ And contact reduction

 $00:31:36.750 \longrightarrow 00:31:40.100$ is when you try to reduce the amount of social mixing.

 $00:31:40.100 \longrightarrow 00:31:44.330$ So gathering bands, self isolation, school closures,

 $00{:}31{:}44{.}330 \dashrightarrow 00{:}31{:}47{.}470$ or in the case of HIV reduction and partner number,

 $00{:}31{:}47.470 \dashrightarrow 00{:}31{:}51.210$ those are examples of contact reduction interventions.

 $00:31:51.210 \longrightarrow 00:31:53.690$ And the point of these interventions

 $00{:}31{:}53.690 \dashrightarrow 00{:}31{:}57.023$ however we taxonomise them, is to flatten the curve.

00:31:57.880 --> 00:31:59.040 We've all heard about that now,

00:31:59.040 --> 00:32:01.420 but why are we trying to flatten the curve?

00:32:01.420 --> 00:32:02.930 We're trying to spread out,

 $00:32:02.930 \longrightarrow 00:32:04.270$ we're trying to this wave

 $00:32:04.270 \longrightarrow 00:32:05.980$ is about to hit us with a new pathogen

 $00:32:05.980 \longrightarrow 00:32:07.420$ for which we have no immunity.

 $00:32:07.420 \longrightarrow 00:32:09.290$ And the force, the compressive force

 $00:32:09.290 \longrightarrow 00:32:11.410$ of the wave is gonna hit us,

 $00:32:11.410 \longrightarrow 00:32:13.900$ what we're trying to do is deaden the wave, slow it down,

00:32:13.900 --> 00:32:16.180 like build breakwaters offshore,

 $00:32:16.180 \longrightarrow 00:32:19.860$ so maybe even if the same amount of water comes ashore,

00:32:19.860 --> 00:32:22.073 it will come ashore with lower intensity.

 $00:32:23.270 \longrightarrow 00:32:24.370$ So that's what we're trying to do.

 $00:32:24.370 \longrightarrow 00:32:26.710$ We're trying to flatten the curve.

 $00:32:26.710 \longrightarrow 00:32:28.550$ And what we mean by that

 $00:32:28.550 \longrightarrow 00:32:31.360$ is that we are going to allow the healthcare system

 $00:32:31.360 \longrightarrow 00:32:33.570$ and the supply chains time to work.

 $00:32:33.570 \longrightarrow 00:32:35.070$ By flattening the curve,

 $00:32:35.070 \longrightarrow 00:32:36.810$ maybe we can save more lives

 $00:32:36.810 \longrightarrow 00:32:39.270$ by not overwhelming our healthcare system.

- $00:32:39.270 \longrightarrow 00:32:40.163$ That's one bit.
- $00:32:41.050 \longrightarrow 00:32:43.230$ The second reason we flatten the curve
- $00:32:43.230 \longrightarrow 00:32:45.030$ is that it postpones some cases
- $00:32:45.030 \longrightarrow 00:32:47.023$ and deaths into the future,
- 00:32:47.880 --> 00:32:50.160 at which time we might have a vaccine,
- 00:32:50.160 --> 00:32:52.060 that might prevent some of the deaths
- 00:32:52.060 --> 00:32:53.460 or we might have better knowledge
- $00:32:53.460 \longrightarrow 00:32:55.020$ of how to treat the condition.
- $00:32:55.020 \longrightarrow 00:32:57.400$ Again, reducing the total number of deaths.
- $00:32:57.400 \longrightarrow 00:32:59.830$ So flattening the curve could reduce deaths
- $00:32:59.830 \dashrightarrow 00:33:04.260$ in this way as well merely by the postponement function.
- 00:33:04.260 --> 00:33:05.820 And finally flattening the curve
- $00:\!33:\!05.820$ --> $00:\!33:\!09.750$ may be beneficial because it postpones some of the cases
- 00:33:09.750 --> 00:33:12.830 to occur at a time when the pathogen might,
- 00:33:12.830 --> 00:33:16.800 if we're lucky, have mutated to be less deadly.
- $00:33:16.800 \longrightarrow 00:33:18.590$ Remember, we mentioned this earlier.
- $00:33:18.590 \longrightarrow 00:33:20.750$ So if the pathogen has become less deadly,
- $00:33:20.750 \longrightarrow 00:33:22.540$ people will become infected in the future,
- $00:33:22.540 \longrightarrow 00:33:26.330$ we'll get a milder variant of the disease.
- $00:33:26.330 \dashrightarrow 00:33:29.570$ But to be clear, what flattening the curve does not do
- $00:33:31.546 \longrightarrow 00:33:33.790$ is eradicate the pathogen.
- $00:33:33.790 \longrightarrow 00:33:36.400$ What we are doing is stopping transmission,
- $00:33:36.400 \longrightarrow 00:33:38.790$ not killing the germ.
- 00:33:38.790 --> 00:33:42.300 The pathogen is still there, and it's going to come back.
- 00:33:42.300 --> 00:33:44.300 It's coming back in Asia,
- 00:33:44.300 --> 00:33:46.630 it's gonna come back in the United States,
- $00:33:46.630 \longrightarrow 00:33:49.380$ there is no escaping from this.
- $00:33:49.380 \longrightarrow 00:33:51.900$ The pathogen is now a feature of our environment

```
00:33:51.900 \longrightarrow 00:33:53.653 with which we must cope.
```

 $00:33:55.000 \longrightarrow 00:33:57.010$ Now, one of the features of this pandemic

00:33:57.010 --> 00:33:58.600 I won't spend much time on it

 $00:33:58.600 \longrightarrow 00:34:01.270$ is the affliction of healthcare workers,

 $00:34:01.270 \longrightarrow 00:34:04.300$ why health care workers were at special risk.

 $00:34:04.300 \longrightarrow 00:34:06.620$ This increased risk of healthcare workers

 $00:34:06.620 \longrightarrow 00:34:09.040$ has been noted since time immemorial.

00:34:09.040 --> 00:34:10.990 Thucydides in the plague of Athens

 $00:34:10.990 \longrightarrow 00:34:13.940$ in 430 BC, talks about how doctors

 $00:34:13.940 \longrightarrow 00:34:15.800$ are dying in greater numbers

 $00:34:15.800 \longrightarrow 00:34:17.060$ and knew the reason.

00:34:17.060 --> 00:34:18.670 It's because they're having contact

 $00:34:18.670 \longrightarrow 00:34:20.080$ with sick patients.

 $00:34:20.080 \longrightarrow 00:34:22.330$ The same thing is happening in our society

00:34:22.330 --> 00:34:25.320 and happened in China and happened in Italy.

 $00:34:25.320 \longrightarrow 00:34:27.160$ And part of the reason they're at special risk

 $00:34:27.160 \longrightarrow 00:34:28.670$ is that health care workers

00:34:28.670 --> 00:34:30.960 in the course of caring for path people,

 $00:34:30.960 \longrightarrow 00:34:32.390$ especially when they have not had

 $00:34:32.390 \longrightarrow 00:34:35.460$ adequate personal protective equipment,

00:34:35.460 --> 00:34:39.600 the lack of which has enraged me, in our society.

 $00:34:39.600 \longrightarrow 00:34:42.530$ The reason is they get high viral inoculum.

00:34:42.530 --> 00:34:44.080 So they're up close working with the patient,

 $00:34:44.080 \longrightarrow 00:34:46.320$ the patient coughs in their face.

 $00{:}34{:}46.320 \dashrightarrow 00{:}34{:}49.860$ So they, you might get the germ from touching something

 $00{:}34{:}49.860 \dashrightarrow 00{:}34{:}53.600$ in the subway, or interacting with a colleague at work

 $00:34:53.600 \longrightarrow 00:34:56.620$ who speaks loudly and some number of particles

00:34:56.620 --> 00:34:57.680 leave that person's mouth

00:34:57.680 --> 00:35:01.380 and enter your body, by the time those viruses

```
00:35:01.380 \longrightarrow 00:35:04.070 are able to multiply, your body might be able
```

 $00:35:04.070 \longrightarrow 00:35:07.020$ to mount an immune system, immune response

 $00:35:07.020 \longrightarrow 00:35:08.870$ and clamp down on the infection

 $00:35:08.870 \longrightarrow 00:35:11.560$ so you don't get a serious infection.

00:35:11.560 --> 00:35:14.910 But a healthcare worker getting a high viral load,

 $00:35:14.910 \longrightarrow 00:35:19.910$ a large inoculum actually can't do that, is overwhelmed,

 $00:35:20.020 \longrightarrow 00:35:21.670$ their body is overwhelmed.

00:35:21.670 --> 00:35:23.410 And there's a very moving website

 $00:35:23.410 \longrightarrow 00:35:26.470$ that's tracking the needs of healthcare workers

 $00{:}35{:}26.470 \dashrightarrow 00{:}35{:}29.310$ around the world who have died during this pandemic

 $00:35:29.310 \longrightarrow 00:35:31.103$ and it's growing every day.

 $00:35:32.750 \longrightarrow 00:35:34.040$ Other places of outbreaks

 $00:35:34.040 \longrightarrow 00:35:37.523$ have been nursing homes, prisons, ships.

 $00:35:38.730 \longrightarrow 00:35:40.270$ You've all heard about the cruise ships

 $00:35:40.270 \longrightarrow 00:35:42.870$ and of course the aircraft carrier

 $00:35:42.870 \longrightarrow 00:35:44.640$ and meatpacking plants,

00:35:44.640 --> 00:35:46.620 which is a very interesting if you want,

 $00:35:46.620 \longrightarrow 00:35:49.430$ we can talk a little bit about the packing plants.

 $00:35:49.430 \longrightarrow 00:35:52.210$ The burden of this illness falls harder on men.

 $00:35:52.210 \longrightarrow 00:35:55.050$ Men are more likely to die to get it and to die.

00:35:55.050 --> 00:35:57.140 But equally likely to get it

00:35:57.140 --> 00:35:59.870 but they're more likely to die than women.

 $00:35:59.870 \longrightarrow 00:36:02.250$ And as is typical of infectious diseases,

 $00:36:02.250 \longrightarrow 00:36:04.060$ it's socially stratified,

 $00:36:04.060 \longrightarrow 00:36:07.250$ the poor and the marginalized and the sick

 $00:36:07.250 \longrightarrow 00:36:11.563$ are more prone to die of this condition.

 $00:36:13.180 \longrightarrow 00:36:16.030$ Now, let's turn briefly to this issue of waves

 $00:36:16.030 \longrightarrow 00:36:17.193$ of the pandemic.

 $00:36:19.750 \longrightarrow 00:36:20.720$ Because I think

 $00:36:22.470 \longrightarrow 00:36:23.853$ it's a serious problem.

 $00:36:24.960 \longrightarrow 00:36:27.980$ Every respiratory pandemic, in the last century

 $00:36:27.980 \longrightarrow 00:36:29.767$ has had multiple waves.

 $00:36:29.767 \longrightarrow 00:36:32.720$ And these typically recur in the fall.

00:36:32.720 --> 00:36:33.940 Not always, I think,

00:36:33.940 --> 00:36:37.150 because of all the protests that we've seen and the rush

 $00:36:37.150 \longrightarrow 00:36:42.150$ to even before the protest, the rush to leave the lockdowns,

 $00:36:42.220 \longrightarrow 00:36:44.400$ I think we're gonna see an earlier wave

 $00:36:44.400 \longrightarrow 00:36:45.503$ in the United States.

 $00:36:46.620 \longrightarrow 00:36:50.490$ And these waves typically come every year

 $00:36:50.490 \longrightarrow 00:36:51.580$ for two or three years

 $00:36:51.580 \dashrightarrow 00:36:55.203$ until eventually the epidemic becomes endemic in us.

 $00:36:56.050 \longrightarrow 00:37:01.010$ We saw waves in 2009 with a very mild H1N1 pandemic,

 $00:37:01.010 \longrightarrow 00:37:03.210$ there was a pandemic in 2009,

 $00:37:03.210 \longrightarrow 00:37:04.900$ but that pathogen was not very deadly.

 $00:37:04.900 \longrightarrow 00:37:06.360$ So nobody noticed.

 $00:37:06.360 \dashrightarrow 00:37:08.420$ It was actually less deadly than the flu.

 $00{:}37{:}08.420 \dashrightarrow 00{:}37{:}09.830$ So it circulated the whole world

 $00:37:09.830 \longrightarrow 00:37:12.720$ there were waves, we can see the waves of H1N1,

 $00:37:12.720 \longrightarrow 00:37:15.850$ but we didn't care because it didn't kill very many people.

 $00:37:15.850 \longrightarrow 00:37:19.090$ The 1918 pandemic,

 $00:37:19.090 \longrightarrow 00:37:22.490$ the second wave famously came out of phase

 $00:37:22.490 \longrightarrow 00:37:23.323$ with the first wave.

 $00:37:23.323 \longrightarrow 00:37:24.540$ There's some interesting theories

 $00:37:24.540 \longrightarrow 00:37:27.140$ as to why and was much four times

 $00:37:27.140 \longrightarrow 00:37:29.120$ as deadly as the first wave.

 $00{:}37{:}29.120 \dashrightarrow 00{:}37{:}32.417$ We have no way of knowing how deadly the Coronavirus

```
00:37:32.417 \longrightarrow 00:37:34.123 the second wave will be.
```

00:37:35.250 --> 00:37:37.750 But I don't believe it'll be less deadly

 $00:37:37.750 \longrightarrow 00:37:41.500$ than the first wave for various reasons.

 $00:37:41.500 \longrightarrow 00:37:42.730$ Now the reason for the occurrence

 $00:37:42.730 \longrightarrow 00:37:45.300$ of these waves, it's complicated.

00:37:45.300 --> 00:37:47.770 It has to do with human behavior in part,

 $00:37:47.770 \longrightarrow 00:37:50.030$ which is the fact that people return to school

 $00:37:50.030 \longrightarrow 00:37:52.600$ and move indoors with the coming of the fall

 $00:37:52.600 \longrightarrow 00:37:53.880$ and it gets colder.

 $00:37:53.880 \longrightarrow 00:37:56.820$ It has perhaps to do with environmental factors

 $00:37:56.820 \longrightarrow 00:37:57.960$ to the extent that heat

 $00:37:57.960 \longrightarrow 00:37:59.820$ and humidity affect the spread

 $00:37:59.820 \longrightarrow 00:38:03.490$ or modify our body's resistance to the pathogen.

00:38:03.490 --> 00:38:05.840 And of course, the epidemic right now has gone

 $00:38:05.840 \longrightarrow 00:38:08.520$ to the southern hemisphere and is raging there.

00:38:08.520 --> 00:38:11.210 And Brazil is having for a number of reasons,

 $00:38:11.210 \longrightarrow 00:38:12.710$ including that it didn't make any efforts

 $00:38:12.710 \longrightarrow 00:38:14.090$ to do anything about it.

 $00:38:14.090 \dashrightarrow 00:38:16.940$ You know, many, many hundreds of thousands of people

 $00:38:16.940 \longrightarrow 00:38:19.113$ are going to die in Brazil.

00:38:19.990 --> 00:38:21.543 Incidentally, I should mention.

 $00:38:23.350 \longrightarrow 00:38:25.450$ I'll just take a small digression

 $00:38:25.450 \longrightarrow 00:38:28.830$ that there's a lot of geographic variation

 $00:38:28.830 \longrightarrow 00:38:30.260$ with these respiratory pandemics.

 $00{:}38{:}30.260 \to 00{:}38{:}32.010$ And we don't fully know the reason.

00:38:32.010 --> 00:38:34.900 For example, in the 1957 pandemic,

 $00:38:34.900 \longrightarrow 00:38:36.790$ there was a 30-fold variation

 $00:38:36.790 \longrightarrow 00:38:38.440$ in the final attack rate,

 $00:38:38.440 \longrightarrow 00:38:40.520$ the number of people that got the disease.

 $00:38:40.520 \dashrightarrow 00:38:45.520$ So Chile was really hard hit and Egypt was spared in 1957.

 $00:38:45.940 \longrightarrow 00:38:47.540$ We're gonna say that see the same thing

 $00:38:47.540 \longrightarrow 00:38:49.770$ with this pandemic, some parts of the country

 $00:38:49.770 \longrightarrow 00:38:51.290$ will be very hard hit,

00:38:51.290 --> 00:38:53.710 other parts of the country will not,

 $00:38:53.710 \dashrightarrow 00:38:57.070$ some countries in the world will be hard hit, some will not.

 $00{:}38{:}57.070 \dashrightarrow 00{:}39{:}00.260$ Sometimes this will have to do with the temperature

 $00:39:00.260 \longrightarrow 00:39:02.420$ in the region, sometimes it'll have to do with what

 $00:39:02.420 \longrightarrow 00:39:04.280$ the nations did in response.

00:39:04.280 --> 00:39:06.940 But mostly, most of the variants will be chance,

 $00:39:06.940 \longrightarrow 00:39:10.080$ as far as we can tell from previous analyses

 $00:39:10.080 \longrightarrow 00:39:12.980$ of geographic variation in the pandemic.

00:39:12.980 --> 00:39:17.130 Anyway, Brazil is being hard hit at the moment.

00:39:17.130 --> 00:39:19.220 But the point I wanna make about this

 $00:39:19.220 \ensuremath{\longrightarrow} > 00:39:23.230$ is that these waves illustrate the fundamental point.

 $00:39:23.230 \dashrightarrow 00:39:27.230$ But this epidemic is going to become endemic among us.

 $00:39:27.230 \longrightarrow 00:39:29.383$ Either we will develop herd immunity,

 $00:39:30.810 \longrightarrow 00:39:33.130$ probably at around 50%, ultimately,

 $00:39:33.130 \longrightarrow 00:39:34.720$ of people will be required.

 $00{:}39{:}34.720 \dashrightarrow 00{:}39{:}37.490$ And we can talk about, there's a subtle detail here.

 $00:39:37.490 \longrightarrow 00:39:40.580$ So, if you can compute the fraction of people

 $00:39:40.580 \longrightarrow 00:39:41.720$ that need to be infected

 $00:39:41.720 \longrightarrow 00:39:44.720$ before you get herd immunity naturally infected

 $00:39:44.720 \longrightarrow 00:39:47.610$ and naturally immune before you get herd immunity,

 $00:39:47.610 \longrightarrow 00:39:48.580$ with a little formula

00:39:48.580 --> 00:39:51.290 that relies on the R naught of the pathogen,

00:39:51.290 --> 00:39:53.630 as we mentioned earlier, in the case of measles,

 $00:39:53.630 \longrightarrow 00:39:56.330$ this epidemic has an R,

00:39:56.330 --> 00:39:57.970 let's say around two and a half,

 $00:39:57.970 \dashrightarrow 00:40:00.900$ it means that about 60% of people need to be immune

 $00:40:00.900 \longrightarrow 00:40:04.543$ before the epidemic goes away.

 $00{:}40{:}06.209 \dashrightarrow 00{:}40{:}10.550$ But actually, you can sometimes reach herd immunity

 $00:40:10.550 \longrightarrow 00:40:12.200$ at lower percentages,

 $00:40:12.200 \longrightarrow 00:40:15.170$ because of the fact that human populations

 $00:40:15.170 \longrightarrow 00:40:16.750$ are not well mixed,

 $00:40:16.750 \longrightarrow 00:40:19.170$ they have a structured, a network structure.

 $00{:}40{:}19.170 \dashrightarrow 00{:}40{:}24.150$ So typically popular people are more likely to get infected

 $00:40:24.150 \longrightarrow 00:40:26.280$ and therefore more likely to get immune.

00:40:26.280 --> 00:40:27.880 And once they become immune,

00:40:27.880 --> 00:40:30.300 they're no longer pathways for the movement,

 $00{:}40{:}30.300 \dashrightarrow 00{:}40{:}33.340$ they're no longer vectors for the movement of the pathogen.

00:40:33.340 --> 00:40:35.630 So in fact, if you immunize,

 $00:40:35.630 \longrightarrow 00:40:38.090$ let's say, 30% of the most popular people

 $00:40:38.090 \longrightarrow 00:40:40.790$ in a population, you could reach herd immunity

00:40:40.790 --> 00:40:42.620 at lower percentages.

00:40:42.620 --> 00:40:43.910 So, in practice,

 $00:40:43.910 \longrightarrow 00:40:46.360$ what we typically find is that herd immunity

 $00{:}40{:}46.360 \dashrightarrow 00{:}40{:}48.740$ is reached at a lower percentage.

 $00:40:48.740 \longrightarrow 00:40:51.920$ This is, you know, the pre-pharmaceutical era

 $00:40:51.920 \longrightarrow 00:40:55.040$ at a lower percentage than you would predict

 $00{:}40{:}55.040 \dashrightarrow 00{:}40{:}56.630$ based on the amount of the R naught of the pathogen,

 $00:40:56.630 \longrightarrow 00:40:59.190$ for example in 1957,

 $00:40:59.190 \longrightarrow 00:41:02.430$ the epidemic maxed out at around 40%,

- $00:41:02.430 \longrightarrow 00:41:03.487$ was the final attack rate,
- $00:41:03.487 \longrightarrow 00:41:07.160$ you know from retrospective serology studies
- $00:41:07.160 \longrightarrow 00:41:09.393$ that were done after the epidemic.
- 00:41:12.189 --> 00:41:14.150 So, in our case with this pandemic,
- $00:41:14.150 \longrightarrow 00:41:17.920$ either we will get herd immunity, or we will get a vaccine.
- $00{:}41{:}17.920 \dashrightarrow 00{:}41{:}22.920$ And I've now concluded that for whatever it's worth,
- $00{:}41{:}23.010 \dashrightarrow 00{:}41{:}25.550$ that it doesn't really matter which of those two we get
- $00:41:25.550 \longrightarrow 00:41:28.760$ to first because there'll be approximately at the same time,
- $00:41:28.760 \longrightarrow 00:41:30.920$ the likelihood that we will be able to invent
- 00:41:30.920 --> 00:41:35.920 a good vaccine, fast enough, manufactured
- $00:41:35.990 \longrightarrow 00:41:40.020$ and distributed fast enough to outstrip
- $00:41:40.020 \longrightarrow 00:41:42.880$ the inevitable herd immunity seems low to me.
- 00:41:42.880 --> 00:41:45.300 I do think we will get a vaccine eventually,
- $00:41:45.300 \longrightarrow 00:41:47.320$ but I'm no longer putting my hopes
- 00:41:47.320 --> 00:41:50.440 in that as an exit strategy for this pandemic.
- 00:41:50.440 --> 00:41:51.273 Maybe we'll get lucky.
- 00:41:51.273 --> 00:41:53.770 I hope I'm disproven,
- 00:41:53.770 --> 00:41:56.690 not disprove it, but I hope that doesn't prove
- $00:41:56.690 \longrightarrow 00:41:57.533$ to be the case.
- 00:41:59.470 --> 00:42:01.350 So the attack rate if you multiply
- $00:42:01.350 \longrightarrow 00:42:02.620$ all these quantities together
- $00:42:02.620 \longrightarrow 00:42:03.980$ that I've been telling you,
- 00:42:03.980 --> 00:42:05.260 in the end for this pandemic,
- $00:42:05.260 \longrightarrow 00:42:08.930$ in my view will be 40 to 50%.
- 00:42:08.930 --> 00:42:11.583 Maybe more probably higher if we overshoot,
- 00:42:12.780 --> 00:42:14.860 which is another thing, you know,
- $00:42:14.860 \longrightarrow 00:42:16.530$ the epidemic rages onward

 $00:42:16.530 \longrightarrow 00:42:19.333$ before we have a time to actually catch up with it.

00:42:20.645 --> 00:42:23.830 And this partly relates to the issue of who are,

00:42:23.830 --> 00:42:26.230 you know, like I already said, the popular people

 $00:42:26.230 \longrightarrow 00:42:28.493$ and the acquisition of immunity.

 $00{:}42{:}29.910 \dashrightarrow 00{:}42{:}32.610$ Now, where do we stand with this pandemic so far?

00:42:32.610 --> 00:42:34.350 If you look at Cyril prevalence studies

 $00:42:34.350 \longrightarrow 00:42:36.070$ to date in Sweden,

 $00{:}42{:}36.070 \dashrightarrow 00{:}42{:}39.340$ which has adopted a pretty mild approach

 $00:42:39.340 \longrightarrow 00:42:40.430$ to coping with it.

00:42:40.430 --> 00:42:44.300 Nationwide there are about 4% of people have had the disease

00:42:44.300 --> 00:42:46.700 and are now immune, I think in Stockholm

 $00:42:46.700 \longrightarrow 00:42:48.580$ with seven or eight or 9%

00:42:48.580 --> 00:42:51.620 in the most densely populated part of Sweden.

00:42:51.620 --> 00:42:53.690 In New York City, it's about 21%

 $00:42:53.690 \longrightarrow 00:42:56.300$ we know from a good study,

00:42:56.300 --> 00:42:58.880 and in various era prevalence studies,

 $00:42:58.880 \longrightarrow 00:43:00.480$ no one has really done a perfect study

 $00{:}43{:}00.480 \dashrightarrow 00{:}43{:}02.200$ at anywhere in the United States.

 $00{:}43{:}02.200 {\:{\circ}{\circ}{\circ}}>00{:}43{:}04.610$ We've been thinking in my lab of doing such a study

 $00:43:04.610 \longrightarrow 00:43:06.170$ in the Greater New Haven area,

00:43:06.170 --> 00:43:07.900 picking a random sample of New Haveners,

 $00:43:07.900 \longrightarrow 00:43:10.930$ and then following them prospectively.

00:43:10.930 --> 00:43:13.700 Most people have done others sub-optimal.

00:43:13.700 --> 00:43:14.630 And I don't criticize them,

00:43:14.630 --> 00:43:19.410 it's difficult to get a random sample of people.

00:43:19.410 --> 00:43:23.150 But if I had to guess, in our cities,

 $00:43:23.150 \longrightarrow 00:43:26.910$ probably we are at no more than 2, 3, 4, 5%

 $00:43:26.910 \longrightarrow 00:43:28.180$ around the country.

- $00:43:28.180 \longrightarrow 00:43:30.310$ So if we're gonna get to an attack rate of 40,
- $00:43:30.310 \longrightarrow 00:43:34.223$ or 50%, we have a long way to go unfortunately.
- $00:43:35.640 \longrightarrow 00:43:36.850$ I think it's important to note
- $00:43:36.850 \longrightarrow 00:43:39.510$ that the United States response to the pandemic
- $00{:}43{:}39.510 \dashrightarrow 00{:}43{:}43.000$ has been awful, has been completely incompetent frankly.
- 00:43:43.000 --> 00:43:45.770 And the failures in my judgment have occurred
- 00:43:45.770 --> 00:43:49.000 at multiple levels of government, but certainly,
- $00:43:49.000 \longrightarrow 00:43:50.980$ at the White House,
- 00:43:50.980 --> 00:43:52.000 has, you know,
- $00:43:52.000 \longrightarrow 00:43:54.710$ there's been an appalling lack of coordination.
- 00:43:54.710 --> 00:43:57.570 I think the expertise at the CDC was there,
- $00:43:57.570 \longrightarrow 00:43:59.970$ but there were men with deep expertise
- 00:43:59.970 --> 00:44:03.210 at the CDC and deep expertise at the National Institute
- 00:44:03.210 --> 00:44:06.113 of Allergic and Infectious Diseases,
- 00:44:08.070 --> 00:44:10.010 but it hasn't been deployed properly.
- 00:44:10.010 --> 00:44:11.100 But I also think it's fair to say
- $00:44:11.100 \longrightarrow 00:44:12.590$ that many of the state governments
- $00:44:12.590 \longrightarrow 00:44:13.930$ were caught flat footed.
- $00{:}44{:}13.930 \dashrightarrow 00{:}44{:}16.130$ And let's also acknowledge that many European countries
- 00:44:16.130 --> 00:44:17.940 that didn't have the incompetence
- $00:44:17.940 \longrightarrow 00:44:20.030$ at the level of the White House
- $00:44:20.030 \longrightarrow 00:44:21.720$ also seem to have been caught flat footed.
- $00:44:21.720 \longrightarrow 00:44:23.570$ I don't understand why.
- $00{:}44{:}23.570 \dashrightarrow 00{:}44{:}26.730$ The you know, it's not a mystery.
- 00:44:26.730 --> 00:44:29.140 I can reach over and grab a book on my shelf
- $00{:}44{:}29.140 \dashrightarrow 00{:}44{:}32.840$ that's called National Strategy for Influenza Pandemic.
- 00:44:32.840 --> 00:44:35.540 Many, many experts knew what was happening
- $00:44:35.540 \longrightarrow 00:44:37.270$ in January and February.

- 00:44:37.270 --> 00:44:41.340 And the Chinese bought us time, you know,
- $00:44:41.340 \longrightarrow 00:44:43.070$ by locking down their nation.
- 00:44:43.070 --> 00:44:44.910 We had two months to look at what was happening
- $00:44:44.910 \longrightarrow 00:44:46.883$ in China and become concerned.
- 00:44:48.320 --> 00:44:51.120 Let me tell you briefly and then I'll shut up.
- $00:44:51.120 \longrightarrow 00:44:53.190$ What are some of the projects that are happening
- $00:44:53.190 \longrightarrow 00:44:54.490$ in my lab right now
- $00:44:56.600 \longrightarrow 00:44:58.657$ which we'd be welcome.
- 00:44:58.657 --> 00:45:00.060 Welcome collaborators.
- $00:45:00.060 \longrightarrow 00:45:02.860$ And Laura's cooperating with us on some of these things.
- $00:45:03.740 \longrightarrow 00:45:07.780$ We have ongoing work on using big data techniques.
- $00:45:07.780 \longrightarrow 00:45:10.423$ Laura mentioned this paper on human movements.
- $00:45:11.670 \longrightarrow 00:45:13.500$ Many scientists are working on this right now
- $00:45:13.500 \longrightarrow 00:45:14.790$ and there are labs around the world
- $00:45:14.790 \longrightarrow 00:45:16.120$ that are famous for this.
- $00:45:16.120 \longrightarrow 00:45:18.760$ We're trying to contribute to that in a certain way,
- 00:45:18.760 --> 00:45:23.760 a tracking human movements or symptom reporting,
- $00{:}45{:}24.120 \dashrightarrow 00{:}45{:}26.270$ that will using various Big Data techniques,
- $00{:}45{:}26.270$ --> $00{:}45{:}29.260$ including Twitter data that would allow us to forecast
- 00:45:29.260 --> 00:45:31.230 the course of the epidemic, to get ahead of it,
- $00:45:31.230 \longrightarrow 00:45:32.800$ to know where it's gonna strike
- $00{:}45{:}32.800 \dashrightarrow 00{:}45{:}34.160$ based on knowing what's happening.
- 00:45:34.160 --> 00:45:36.000 Another similar project like that,
- $00:45:36.000 \longrightarrow 00:45:37.760$ being spearheaded by another graduate student
- $00:45:37.760 \longrightarrow 00:45:41.430$ in my lab, Eric Feltham is looking at gatherings.
- $00{:}45{:}41.430 \dashrightarrow 00{:}45{:}43.660$ For example, we were very interested in the gatherings
- $00:45:43.660 \longrightarrow 00:45:45.360$ to vote the primary elections.

```
00:45:45.360 \longrightarrow 00:45:47.610 Did they, you know, people got together to vote
```

00:45:47.610 --> 00:45:50.150 at polling places, did that cause a spike?

 $00:45:50.150 \longrightarrow 00:45:53.930$ This is of course highly relevant to our national security,

 $00:45:53.930 \longrightarrow 00:45:56.290$ we need to somehow have a good vote, a fair

00:45:56.290 --> 00:45:59.480 and honest vote in November and for that,

 $00{:}45{:}59.480 \dashrightarrow 00{:}46{:}02.420$ in my judgment, We need to have wide spread absentee

 $00:46:02.420 \longrightarrow 00:46:04.680$ balloting to allow for this.

 $00:46:04.680 \longrightarrow 00:46:07.160$ Otherwise, if people stay away from the polls,

 $00{:}46{:}07.160 \dashrightarrow 00{:}46{:}09.291$ because they're a fraid of the pandemic,

 $00:46:09.291 \longrightarrow 00:46:12.470$ or if they go to the polls and then become infected,

 $00:46:12.470 \longrightarrow 00:46:13.560$ either one of those outcomes

 $00:46:13.560 \longrightarrow 00:46:16.410$ is a threat to our society in my view.

 $00{:}46{:}16.410 \dashrightarrow 00{:}46{:}18.700$ But similarly, I believe that the recent protests

00:46:18.700 --> 00:46:23.040 that we've seen after the appalling murder

 $00:46:23.040 \longrightarrow 00:46:24.433$ that we saw in Minnesota,

 $00:46:26.700 \longrightarrow 00:46:29.060$ and the rioting that we've seen,

00:46:29.060 --> 00:46:31.660 are gonna contribute to a spike in cases

 $00:46:31.660 \longrightarrow 00:46:34.490$ and I mentioned this earlier.

 $00{:}46{:}34.490 \dashrightarrow 00{:}46{:}36.630$ Finally, we had just released last week

 $00:46:36.630 \longrightarrow 00:46:37.986$ an app from my lab.

00:46:37.986 --> 00:46:41.413 That's called Hunala, hunala.yale.edu.

00:46:47.160 --> 00:46:49.840 This app relies on some old ideas of ours,

 $00:46:49.840 \longrightarrow 00:46:51.880$ involving network science

 $00:46:51.880 \longrightarrow 00:46:53.750$ that I previously discussed with Raphael

 $00:46:53.750 \longrightarrow 00:46:56.283$ and others on this call,

00:46:57.250 --> 00:46:58.710 which is that if you think about

 $00:46:58.710 \longrightarrow 00:47:02.600$ a contagion that begins stochastically in a graph,

 $00:47:02.600 \longrightarrow 00:47:03.650$ you should have the intuition,

 $00:47:03.650 \longrightarrow 00:47:04.553$ it's obvious that the contagion

- 00:47:04.553 --> 00:47:07.550 as it winds its way a social contagion,
- $00:47:07.550 \longrightarrow 00:47:09.910$ winds its way a biological contagion,
- 00:47:09.910 --> 00:47:11.410 that winds its way through the graph
- 00:47:11.410 --> 00:47:13.230 is gonna reach central people
- $00:47:13.230 \longrightarrow 00:47:16.590$ so oner than it reaches random people in the population.
- 00:47:16.590 --> 00:47:19.470 So if we could identify central people,
- $00:47:19.470 \longrightarrow 00:47:21.680$ and monitor them, they would function
- $00:47:21.680 \longrightarrow 00:47:24.080$ as a kind of canary in a coal mine
- $00:47:24.080 \dashrightarrow 00:47:28.090$ forecasting the state of the epidemic at some future time.
- $00{:}47{:}28.090 \dashrightarrow 00{:}47{:}31.040$ We published several papers about this 10 years ago,
- $00:47:31.040 \longrightarrow 00:47:34.060$ that showed that we could do it with each one and one,
- 00:47:34.060 --> 00:47:36.070 that we could track central people,
- $00:47:36.070 \longrightarrow 00:47:37.633$ and that we can monitor them.
- $00:47:39.028 \longrightarrow 00:47:41.650$ And then we would therefore be able to use them
- 00:47:41.650 --> 00:47:44.170 to predict the future state of the epidemic
- $00:47:44.170 \longrightarrow 00:47:47.463$ between two and six weeks in advance.
- $00{:}47{:}48.700 \dashrightarrow 00{:}47{:}51.710$ So this is one of the things that our app
- $00:47:51.710 \longrightarrow 00:47:53.410$ is attempting to exploit.
- $00{:}47{:}53.410 \dashrightarrow 00{:}47{:}57.020$ we're attempting to get people to report their symptoms
- $00:47:57.020 \longrightarrow 00:47:59.620$ and then we are attempting to monitor that
- $00:47:59.620 \longrightarrow 00:48:04.620$ or redraw the graph anonymously or privately.
- $00:48:04.640 \longrightarrow 00:48:06.290$ We don't inform anyone
- $00{:}48{:}06.290 \dashrightarrow 00{:}48{:}09.790$ for example, if you get sick, we do not inform your friends
- $00:48:09.790 \longrightarrow 00:48:11.520$ that you are sick.
- 00:48:11.520 --> 00:48:13.470 But we exploit people's reports
- $00:48:13.470 \longrightarrow 00:48:17.010$ to create a kind of ways for Coronavirus.
- $00:48:17.010 \longrightarrow 00:48:19.430$ So everyone contributes a little information

- $00:48:19.430 \longrightarrow 00:48:21.800$ saying whether or not they have symptoms.
- $00{:}48{:}21.800 --> 00{:}48{:}25.720$ And we can then by manipulating that information
- 00:48:25.720 --> 00:48:27.970 using some machine learning algorithms
- $00:48:27.970 \longrightarrow 00:48:30.250$ in partnership with a mean car buses group
- $00:48:30.250 \longrightarrow 00:48:32.853$ in the electrical engineering department here.
- $00{:}48{:}34.090 \rightarrow 00{:}48{:}38.120$ We can predict what your risk of getting the epidemic
- $00:48:38.120 \longrightarrow 00:48:38.953$ is in the future.
- $00:48:38.953 \longrightarrow 00:48:41.190$ So if your friends friends
- 00:48:41.190 --> 00:48:45.020 had respiratory disease three weeks ago,
- $00:48:45.020 \longrightarrow 00:48:46.840$ that should modify your risk.
- 00:48:46.840 --> 00:48:49.970 Or if your friends had a fever a week ago,
- $00:48:49.970 \longrightarrow 00:48:51.840$ that should modify your risk.
- $00:48:51.840 \longrightarrow 00:48:54.620$ And so our app is attempting to collect these data
- $00:48:54.620 \longrightarrow 00:48:57.120$ and forecasts the future course of the epidemic.
- 00:48:57.120 --> 00:48:59.780 We expect to have, if we're lucky
- $00:48:59.780 \longrightarrow 00:49:01.853$ and if the app is widely adopted,
- $00:49:03.710 \longrightarrow 00:49:04.543$ we will have a ton
- $00:49:04.543 \longrightarrow 00:49:07.540$ of very difficult complicated data to analyze.
- $00:49:07.540 \longrightarrow 00:49:08.900$ And just because I haven't been as clear
- 00:49:08.900 --> 00:49:10.983 about this as I hope because I'm rushing,
- $00:49:12.370 \longrightarrow 00:49:14.210$ the app is like waves for Coronavirus.
- 00:49:14.210 --> 00:49:16.930 It warns you just like waves does
- 00:49:16.930 --> 00:49:19.440 that there's a traffic jam two miles ahead,
- $00:49:19.440 \longrightarrow 00:49:22.930$ the app can warn you that there is pathogen
- $00:49:22.930 \longrightarrow 00:49:25.090$ in your social network neighborhood.
- $00{:}49{:}25.090 \dashrightarrow 00{:}49{:}27.750$ And just like in ways you might, you know, take an exit
- $00{:}49{:}27.750 \dashrightarrow 00{:}49{:}30.450$ and avoid the traffic jam, with ways you might say,
- $00:49:30.450 \longrightarrow 00:49:32.060$ you know, I'm gonna stay at home now,

- $00:49:32.060 \longrightarrow 00:49:33.800$ because my risk is high.
- $00:49:33.800 \longrightarrow 00:49:37.720$ And we give people daily assessments of their risk
- $00:49:37.720 \longrightarrow 00:49:39.690$ based on where they live.
- $00:49:39.690 \longrightarrow 00:49:42.790$ And here we include lots of public source data
- $00:49:42.790 \longrightarrow 00:49:45.840$ and the reports of our users.
- $00:49:45.840 \longrightarrow 00:49:49.130$ And we give them a risk of like based on where you live,
- $00:49:49.130 \longrightarrow 00:49:51.163$ is the risk low, medium, high.
- $00:49:52.280 \longrightarrow 00:49:55.810$ Like for example, like a fire like a forest fire prediction,
- 00:49:55.810 --> 00:49:57.820 you know, based on the humidity today,
- 00:49:57.820 --> 00:50:00.460 what's the risk of a forest fire?
- $00:50:00.460 \longrightarrow 00:50:03.030$ And, we also give you a personal risk
- $00:50:03.030 \longrightarrow 00:50:04.780$ based on where you are in the network.
- 00:50:04.780 --> 00:50:07.970 So traffic is bad in New York City in general,
- 00:50:07.970 --> 00:50:10.380 but it's really bad on your block right now,
- $00:50:10.380 \longrightarrow 00:50:11.730$ waves might tell you.
- $00:50:11.730 \longrightarrow 00:50:13.773$ So our app also does that.
- 00:50:14.730 --> 00:50:16.620 People have reported seeing a fire,
- 00:50:16.620 --> 00:50:18.660 it's not just that it's dry and hot,
- $00:50:18.660 \longrightarrow 00:50:21.850$ actually other users in your area have seen a fire.
- 00:50:21.850 --> 00:50:25.870 So your risk now is much higher.
- 00:50:25.870 --> 00:50:27.160 So I'm gonna say one last thing,
- $00{:}50{:}27.160 \dashrightarrow 00{:}50{:}31.650$ which is that the issue is when will this epidemic end?
- $00:50:31.650 \longrightarrow 00:50:33.390$ And I already alluded to the fact that
- $00{:}50{:}33.390 \dashrightarrow 00{:}50{:}36.380$ it's gonna end when it becomes endemic among us,
- $00:50:36.380 \longrightarrow 00:50:38.820$ but it's also gonna end,
- $00:50:38.820 \longrightarrow 00:50:42.680$ or epidemics have a biological end and a social end.
- 00:50:42.680 --> 00:50:44.500 And basically, the epidemic is gonna end

- $00:50:44.500 \longrightarrow 00:50:46.370$ when we declare that it's over.
- $00:50:46.370 \longrightarrow 00:50:48.970$ But we have come to accept it.
- $00:50:48.970 \longrightarrow 00:50:51.220$ And so I think we're still in the early phases
- 00:50:51.220 --> 00:50:53.850 of the Kübler-Ross model of grief.
- $00:50:53.850 \longrightarrow 00:50:56.210$ You know, we have anger
- $00:50:57.868 \longrightarrow 00:51:00.790$ and we have sadness, you know, depression.
- 00:51:00.790 --> 00:51:03.210 And we have bargaining, you know,
- 00:51:03.210 --> 00:51:05.430 but soon we're gonna have acceptance,
- $00:51:05.430 \longrightarrow 00:51:10.115$ which is the only way out from this pandemic.
- $00:51:10.115 \longrightarrow 00:51:10.948$ Thank you.
- $00:51:12.100 \longrightarrow 00:51:15.060$ Thank you Nicholas for this great talk.
- $00:51:15.060 \longrightarrow 00:51:16.777$ We have time for questions.
- $00{:}51{:}21.540 --> 00{:}51{:}23.610$ [Jose] Hello, I'm Jose.
- $00:51:23.610 \longrightarrow 00:51:25.120$ So I was curious about the app
- 00:51:26.676 --> 00:51:28.863 that you develop in collecting data.
- $00:51:29.800 \longrightarrow 00:51:34.800$ Are you interested in like, what network properties
- 00:51:35.500 --> 00:51:39.160 are you like hoping to gauge, are you looking into,
- $00{:}51{:}39.160 \dashrightarrow 00{:}51{:}43.840$ like sensitivity, you know, like a core.
- $00:51:44.860 \longrightarrow 00:51:49.860$ And do you have a particular hypotheses about like,
- $00:51:50.000 \longrightarrow 00:51:51.580$ because like when you're in a network,
- 00:51:51.580 --> 00:51:54.240 you receive information,
- 00.51.54.240 -> 00.51.56.260 the more connected you are just like,
- $00{:}51{:}57.230 \dashrightarrow 00{:}52{:}01.160$ for got the term but I think you tend to get more information
- 00:52:01.160 --> 00:52:02.453 based on your connection,
- $00{:}52{:}03.420 \dashrightarrow 00{:}52{:}08.420$ are you expecting that people in certain types of networks
- 00:52:08.440 --> 00:52:09.970 would be reporting
- $00:52:11.420 \longrightarrow 00:52:13.440$ like symptoms like earlier?
- 00:52:13.440 --> 00:52:15.550 Or I was just wondering like,

00:52:15.550 -> 00:52:19.020 what are you hoping to capture using those parameters?

 $00:52:19.020 \longrightarrow 00:52:20.510$ - So we've studied that if you want,

 $00:52:20.510 \longrightarrow 00:52:24.390$ you can look at our 2010 paper on the H1N1.

 $00:52:24.390 \longrightarrow 00:52:27.720$ Networks with low transitivity are at higher risk.

00:52:27.720 --> 00:52:29.860 So individuals that have low transitivity

 $00:52:29.860 \longrightarrow 00:52:31.300$ in their neighborhood are at higher risk

 $00.52:31.300 \longrightarrow 00.52:32.580$ for getting the flu.

00:52:32.580 --> 00:52:34.570 Unsurprisingly, people with higher degree

 $00:52:34.570 \longrightarrow 00:52:35.910$ are at higher risk,

 $00{:}52{:}35.910 \dashrightarrow 00{:}52{:}39.840$ and people that have high centrality are at higher risk.

 $00:52:39.840 \longrightarrow 00:52:41.030$ So we've shown that before.

 $00:52:41.030 \longrightarrow 00:52:44.380$ And eventually we hope if we reach the appropriate scale,

 $00:52:44.380 \longrightarrow 00:52:46.910$ that these parameters will also be relevant.

00:52:46.910 --> 00:52:49.790 But it's not just the structure of the network

 $00:52:49.790 \longrightarrow 00:52:50.660$ as I alluded to earlier.

 $00:52:50.660 \longrightarrow 00:52:52.960$ It's what's happening in the network and when.

 $00:52:52.960 \longrightarrow 00:52:55.410$ So I don't know exactly yet.

 $00{:}52{:}55.410 \dashrightarrow 00{:}52{:}58.640$ We don't have the data yet to know what is the real signal.

 $00{:}52{:}58.640 \dashrightarrow 00{:}53{:}02.960$ is it COVID three weeks ago in your third degree alters.

 $00{:}53{:}02.960 \dashrightarrow 00{:}53{:}07.960$ is it COVID 10 days ago or 12 days ago in your alters?

 $00:53:07.990 \longrightarrow 00:53:10.240$ You know, we don't know all these details yet.

 $00:53:10.240 \dashrightarrow 00:53:12.710$ If we get enough data, we will know the answer.

00:53:12.710 --> 00:53:15.730 But we do know from principles that we published before

 $00:53:15.730 \longrightarrow 00:53:17.790$ and that are mathematically predicted

 $00:53:17.790 \longrightarrow 00:53:18.783$ what should matter.

 $00:53:19.940 \longrightarrow 00:53:24.200$ Excuse me, I've been dying to do a K cornice forecasting.

00:53:24.200 --> 00:53:25.980 And I've been talking to Dan Spielman,

00:53:25.980 --> 00:53:28.420 I actually had to (mumbles) about this for years.

 $00:53:28.420 \longrightarrow 00:53:29.900$ We have another project in Honduras

 $00:53:29.900 \longrightarrow 00:53:31.430$ that Laura's involved with

00:53:31.430 --> 00:53:33.520 where we're gonna look at K cornice,

 $00:53:33.520 \longrightarrow 00:53:35.440$ I don't know whether we'll be able to do with this app.

00:53:35.440 --> 00:53:37.513 It depends on how much use we get.

 $00:53:39.100 \longrightarrow 00:53:40.050$ - [Jose] Thank you.

 $00:53:44.219 \longrightarrow 00:53:46.378$ - Other questions?

00:53:46.378 --> 00:53:48.500 - Yeah, I have a question.

00:53:48.500 --> 00:53:50.860 Hi, my name's Sam Burma, graduate in genetics.

 $00:53:50.860 \longrightarrow 00:53:52.320$ I'm interested in understanding a little bit more

00:53:52.320 --> 00:53:54.810 about the dispersion you're talking about

 $00:53:54.810 \longrightarrow 00:53:57.110$ with the equivalent reproductive,

00:53:57.110 --> 00:53:59.260 the effective reproductive rate of the virus,

 $00:53:59.260 \longrightarrow 00:54:01.520$ and I think I made it just missed a little bit there.

 $00{:}54{:}01.520 --> 00{:}54{:}04.210$ But can you just go back and explain a little bit more

 $00:54:04.210 \longrightarrow 00:54:06.780$ about how this relates to the fact that

 $00:54:06.780 \longrightarrow 00:54:10.810$ there's a lower dispersion rate actually is worse?

 $00:54:10.810 \longrightarrow 00:54:11.710 - Yeah.$

 $00:54:11.710 \longrightarrow 00:54:14.920$ It's a wonderful, beautiful paper by Lloyd Smith

00:54:14.920 --> 00:54:18.520 at all in Nature 2005 which is it's just,

 $00{:}54{:}18.520 \dashrightarrow 00{:}54{:}20.820$ it's like one of those papers, you read it,

00:54:20.820 --> 00:54:22.517 and you get the point that you read and you get

 $00{:}54{:}22.517 \dashrightarrow 00{:}54{:}23.900$ "There's more subtlety here," and then you read it again,

00:54:23.900 --> 00:54:25.640 "There's more subtlety here."

 $00:54:25.640 \longrightarrow 00:54:26.803$ It's a wonderful paper.

- 00:54:28.010 --> 00:54:29.510 The gist is, if you think about it,
- $00:54:29.510 \longrightarrow 00:54:32.010$ and also just incidentally, as an intellectual point,
- $00:54:32.010 \longrightarrow 00:54:33.870$ there's something happening in the sciences.
- $00:54:33.870 \longrightarrow 00:54:35.740$ This is an old issue in the sciences
- $00:54:35.740 \longrightarrow 00:54:37.470$ between lumpers and splitters.
- $00:54:37.470 \longrightarrow 00:54:40.830$ No Darwin talks about this, lumpers and splitters.
- $00:54:40.830 \longrightarrow 00:54:42.450$ There are scientists who are concerned about
- $00:54:42.450 \longrightarrow 00:54:43.830$ getting the sense of a thing
- $00:54:43.830 \longrightarrow 00:54:45.727$ and like the average and they're scientists
- $00:54:45.727 \longrightarrow 00:54:47.540$ who are interested in variants
- 00:54:47.540 --> 00:54:49.600 like what's, you know, what are exceptions?
- $00:54:49.600 \longrightarrow 00:54:50.940$ How do things spread out?
- $00:54:50.940 \longrightarrow 00:54:53.660$ And so much of statistics and social sciences
- $00:54:53.660 \longrightarrow 00:54:56.270$ in the last 50 years has been focused
- 00:54:56.270 --> 00:54:59.060 on measures of central tendency, why?
- $00{:}54{:}59.060 \dashrightarrow 00{:}55{:}01.810$ Because we invented regression models and statistical tools
- $00.55:01.810 \longrightarrow 00.55:04.240$ that were easier for us to say that,
- $00:55:04.240 \longrightarrow 00:55:06.430$ whereas variance is also so important.
- $00:55:06.430 \longrightarrow 00:55:08.347$ And so there's a lot across the social scientists
- $00:55:08.347 \dashrightarrow 00:55:10.070$ and people that are becoming much more interested
- $00:55:10.070 \longrightarrow 00:55:12.150$ in variants and in variation.
- 00.55:12.150 --> 00.55:13.780 And so this is another example of that,
- 00:55:13.780 --> 00:55:15.750 where for a long time, people were, you know,
- $00{:}55{:}15.750 \dashrightarrow 00{:}55{:}17.210$ trying to estimate the R naught.
- 00:55:17.210 --> 00:55:19.420 And Lloyd Smith comes along at all,
- $00{:}55{:}19.420$ --> $00{:}55{:}22.520$ and says, "Wait a minute, the variance is also important."
- $00:55:22.520 \longrightarrow 00:55:23.970$ Why does it matter?
- $00:55:23.970 \longrightarrow 00:55:26.210$ So if everyone in the population
- 00:55:26.210 --> 00:55:28.570 has an R naught of two,

```
00{:}55{:}28.570 \dashrightarrow 00{:}55{:}31.440 then every single time one person goes from one place
```

 $00:55:31.440 \longrightarrow 00:55:34.423$ to another, then we'll restart the epidemic.

 $00:55:35.650 \longrightarrow 00:55:38.120$ But if there's variation and some people

00:55:38.120 --> 00:55:40.400 or most people have an R naught of zero,

 $00:55:40.400 \longrightarrow 00:55:42.100$ they cannot give it to anyone.

 $00:55:42.100 \dashrightarrow 00:55:45.770$ And one out of 100 people can give it to a lot of people,

 $00:55:45.770 \longrightarrow 00:55:48.180$ the epidemic is more likely to extinguish

 $00{:}55{:}48.180 \dashrightarrow 00{:}55{:}50.630$ 'cause 99 out of 100 times when one person

 $00{:}55{:}50.630 \dashrightarrow 00{:}55{:}52.640$ in the latter example goes somewhere,

 $00:55:52.640 \longrightarrow 00:55:54.020$ the epidemic stops.

00:55:54.020 --> 00:55:56.230 Only if that's superspreader,

 $00:55:56.230 \longrightarrow 00:55:58.580$ the person with a capacity to be a superspreader

 $00:55:58.580 \longrightarrow 00:56:00.400$ goes does it get started.

 $00:56:00.400 \longrightarrow 00:56:02.600$ And if it's something intrinsic to the germ,

 $00:56:02.600 \longrightarrow 00:56:04.170$ then in the next cycle,

 $00:56:04.170 \longrightarrow 00:56:08.270$ most of the transmissions will also be zero.

 $00:56:08.270 \longrightarrow 00:56:10.780$ And so this dispersion, which they in that paper,

 $00:56:10.780 \longrightarrow 00:56:13.440$ they quantified across pathogens

 $00:56:13.440 \longrightarrow 00:56:16.540$ seems to fit with the ability of the pathogen

00:56:16.540 --> 00:56:18.023 to get instantiated.

 $00:56:22.030 \longrightarrow 00:56:23.030$ - Thank you so much.

 $00:56:24.546 \longrightarrow 00:56:26.480$ And I also shared that paper in the chat for him.

 $00:56:26.480 \longrightarrow 00:56:28.420$ - Yeah, and also, just so you know,

00:56:28.420 --> 00:56:31.170 it's estimated that with with SARS-2

00:56:31.170 --> 00:56:32.770 what we're currently facing,

 $00:56:32.770 \longrightarrow 00:56:37.770$ is you need four importations to get one transmission,

 $00:56:38.080 \longrightarrow 00:56:39.800$ one community transmission.

 $00:56:39.800 \longrightarrow 00:56:42.850$ So in fact, in Seattle patient zero,

 $00:56:42.850 \longrightarrow 00:56:45.040$ did not infect anybody else.

 $00:56:45.040 \longrightarrow 00:56:47.620$ The first case that arrived in the middle of January,

00:56:47.620 --> 00:56:49.760 when they did contact tracing elaborately,

 $00:56:49.760 \longrightarrow 00:56:51.380$ and now genetic studies,

 $00:56:51.380 \longrightarrow 00:56:52.460$ he didn't infect anyone else.

 $00:56:52.460 \longrightarrow 00:56:53.650$ It was a dead end.

 $00:56:53.650 \longrightarrow 00:56:55.395$ You needed subsequent importations

 $00:56:55.395 \longrightarrow 00:56:58.620$ before the epidemic took root in Seattle.

 $00:56:58.620 \longrightarrow 00:56:59.870$ Same in China by the way.

 $00:57:03.630 \longrightarrow 00:57:04.563$ Other questions?

00:57:06.710 --> 00:57:09.140 It's very weird Zoom, 'cause I can't see you.

00:57:09.140 --> 00:57:10.520 I don't know if I'm boring you,

00:57:10.520 --> 00:57:13.760 I have no way of judging how I'm coming across.

 $00{:}57{:}13.760 \dashrightarrow 00{:}57{:}16.700$ You know, I could be coming across as very aggressive,

 $00:57:16.700 \longrightarrow 00:57:18.350$ which of course not my intention.

00:57:21.592 --> 00:57:22.630 - I mean, if no one else has questions.

 $00:57:22.630 \longrightarrow 00:57:24.510$ I was also wondering what are the factors

 $00:57:24.510 \longrightarrow 00:57:27.030$ that influence our ability to detect the difference

00:57:27.030 --> 00:57:29.120 between the latency and the infectivity period

 $00:57:29.120 \dashrightarrow 00:57:32.720$ 'cause I remember at the early days in the US,

 $00{:}57{:}32.720 \dashrightarrow 00{:}57{:}34.300$ CDC was still saying they didn't think

00:57:34.300 --> 00:57:38.900 that asymptomatic spread was a major factor for COVID-19.

 $00:57:38.900 \longrightarrow 00:57:40.300$ But now it seems like...

 $00{:}57{:}42.360 \dashrightarrow 00{:}57{:}44.050$ - I haven't dug deep in what the CDC

 $00:57:44.050 \longrightarrow 00:57:46.740$ was saying but they knew

 $00:57:46.740 \longrightarrow 00:57:48.150$ there was a symptomatic transmission

 $00:57:48.150 \longrightarrow 00:57:49.793$ certainly by the end of January.

00:57:51.117 --> 00:57:53.590 There's some CDC announcements

00:57:53.590 --> 00:57:55.620 that I haven't traced it all the way back

00:57:55.620 --> 00:57:57.060 but for sure, by the end of January,

- $00:57:57.060 \longrightarrow 00:57:58.510$ they were already saying this
- $00:57:58.510 \longrightarrow 00:58:00.000$ and I think earlier in January too.
- $00:58:00.000 \longrightarrow 00:58:02.373$ There was some confusion in December still,
- 00:58:03.380 --> 00:58:06.023 but certainly by January, people knew.
- $00:58:11.050 \longrightarrow 00:58:12.880$ The genetics of human susceptibility
- $00:58:12.880 \longrightarrow 00:58:14.750$ are very interesting, by the way.
- $00:58:14.750 \longrightarrow 00:58:17.570$ I think we're gonna find that a small part
- $00:58:17.570 \longrightarrow 00:58:20.220$ of the geographic variation will relate
- $00:58:20.220 \longrightarrow 00:58:23.390$ to the genetics of the pathogen.
- $00{:}58{:}23.390 \dashrightarrow 00{:}58{:}27.300$ Right now, there's no evidence that yet that some strains
- $00:58:27.300 \longrightarrow 00:58:28.710$ of the pathogen are more deadly
- $00:58:28.710 \longrightarrow 00:58:30.470$ or more infectious than other streams,
- $00:58:30.470 \longrightarrow 00:58:33.320$ a lot of interest in this topic right now.
- $00:58:33.320 \longrightarrow 00:58:35.260$ We probably will find some of that.
- $00{:}58{:}35.260 \dashrightarrow 00{:}58{:}38.140$ And there's also some small evidence
- $00{:}58{:}38.140 \dashrightarrow 00{:}58{:}40.840$ that human genes, that some people may be more of you
- $00:58:40.840 \longrightarrow 00:58:43.320$ than others, because of, you know,
- $00:58:43.320 \longrightarrow 00:58:46.800$ their various variants still to be described.
- $00:58:46.800 \longrightarrow 00:58:48.340$ So I think that's gonna be
- $00:58:48.340 \longrightarrow 00:58:49.790$ and I think that'll be a small part
- $00{:}58{:}49.790 \dashrightarrow 00{:}58{:}52.590$ of explaining that geographic variation, not a big part.
- $00{:}58{:}53.490 \dashrightarrow 00{:}58{:}56.343$ Nicholas, Luke here in the chat box has a question.
- $00{:}58{:}57.340 \dashrightarrow 00{:}59{:}00.870$ He's interested in your thoughts about transmission settings
- 00:59:00.870 --> 00:59:03.110 like nursing homes, meatpacking.
- $00:59:03.110 \longrightarrow 00:59:05.693$ Is it network structures susceptibility
- $00:59:05.693 \longrightarrow 00:59:08.450$ excetera driving transmission?
- $00:59:08.450 \longrightarrow 00:59:09.820$ Well, I think the meatpacking,

 $00:59:09.820 \longrightarrow 00:59:12.730$ the story for the meat packers was aerosolization

 $00:59:12.730 \longrightarrow 00:59:15.170$ of the pathogen in a cold environment

 $00:59:15.170 \longrightarrow 00:59:18.250$ and high density and I have a long Twitter thread

 $00:59:18.250 \longrightarrow 00:59:22.100$ on this if anyone is interested on why meatpacking

00:59:22.100 --> 00:59:23.570 and it's a worldwide phenomenon,

 $00:59:23.570 \longrightarrow 00:59:26.310$ it's not just a phenomenon in the United States.

 $00{:}59{:}26.310 --> 00{:}59{:}30.835$ So I think the explanation by the Secretary of Health,

00:59:30.835 --> 00:59:33.270 the Secretary of Health in our country,

 $00:59:33.270 \longrightarrow 00:59:35.390$ that it had to do with the living arrangements

 $00:59:35.390 \longrightarrow 00:59:38.320$ of the immigrants working in these factories,

 $00:59:38.320 \longrightarrow 00:59:39.720$ is not correct.

 $00:59:39.720 \longrightarrow 00:59:40.750$ There are other factories

 $00{:}59{:}40.750 \dashrightarrow 00{:}59{:}43.920$ with other industries with similar immigrant populations

 $00:59:43.920 \longrightarrow 00:59:45.320$ and similar living conditions

 $00:59:45.320 \longrightarrow 00:59:46.490$ and they didn't have the operates.

 $00:59:46.490 \longrightarrow 00:59:49.870$ I think it's to do with the temperature in the environment

 $00:59:49.870 \longrightarrow 00:59:50.703$ where these people work.

 $00{:}59{:}50.703 \dashrightarrow 00{:}59{:}54.090$ It's refrigerated, the very tight packing of the workers

 $00{:}59{:}54.090 --> 00{:}59{:}57.880$ and up aerosolization using saws and other equipment

 $00:59:57.880 \longrightarrow 00:59:59.010$ that create aerosols

 $00:59:59.010 \longrightarrow 01:00:01.170$ that are in the turbulent wind conditions

 $01:00:01.170 \longrightarrow 01:00:02.143$ in these factories.

 $01:00:03.680 \longrightarrow 01:00:04.910$ The nursing homes is different,

 $01:00:04.910 \longrightarrow 01:00:08.110$ I think it's a very customary health care situation

 $01:00:08.110 \longrightarrow 01:00:10.480$ where you have very vulnerable elderly people

 $01{:}00{:}10.480 \dashrightarrow 01{:}00{:}12.240$ and health care workers that are up close

01:00:12.240 --> 01:00:13.620 and intimate working with people.

```
01:00:13.620 --> 01:00:15.900 So once the epidemic takes root, you know,
```

- $01:00:15.900 \longrightarrow 01:00:17.610$ you get a very rapid spread.
- $01:00:17.610 \longrightarrow 01:00:20.100$ I think nursing homes are more like prisons, actually,
- 01:00:20.100 --> 01:00:22.760 in terms of their epidemiology,
- $01:00:22.760 \longrightarrow 01:00:24.010$ meatpacking is different.
- 01:00:26.530 --> 01:00:28.040 You know, ships,
- $01:00:28.040 \longrightarrow 01:00:29.650$ ships are close quarters as well.
- 01:00:29.650 --> 01:00:31.660 So you have young people in ships,
- 01:00:31.660 --> 01:00:34.570 you know, in the US's Theodore Roosevelt,
- 01:00:34.570 --> 01:00:36.120 you know, you have young healthy sailors,
- $01:00:36.120 \longrightarrow 01:00:37.600$ although one died already,
- 01:00:37.600 --> 01:00:41.250 we should acknowledge from the disease,
- $01:00:41.250 \longrightarrow 01:00:42.410$ but they're very tight.
- 01:00:42.410 --> 01:00:43.480 People are living in bunks,
- $01{:}00{:}43.480 \dashrightarrow 01{:}00{:}46.130$ you know, one on top of each other in that situation.
- $01:00:49.540 \longrightarrow 01:00:51.520$ Nicholas I have a question.
- $01:00:51.520 \longrightarrow 01:00:53.170$ So we're used to think that
- 01:00:53.170 --> 01:00:56.310 these social distancing measure, these lockdowns,
- 01:00:56.310 --> 01:00:57.320 what they're really doing
- $01:00:57.320 \longrightarrow 01:01:00.420$ is reducing the number of susceptible people
- $01:01:00.420 \longrightarrow 01:01:01.310$ in the population
- $01:01:01:01.310 \longrightarrow 01:01:03.790$ so that essentially we plug in this number,
- $01:01:03.790 \longrightarrow 01:01:05.900$ this lower number in our serial models
- $01:01:05.900 \longrightarrow 01:01:07.620$ and predict the spread.
- $01{:}07{:}07{:}020 \dashrightarrow 01{:}01{:}11.780$ But, I think what in addition to reducing the density
- 01:01:11.780 --> 01:01:13.980 of the network, what they're also doing
- $01:01:13.980 \longrightarrow 01:01:15.630$ is reshaping the network
- 01:01:15.630 --> 01:01:17.670 because essentially the structure of the network
- $01:01:17.670 \longrightarrow 01:01:20.300$ because people don't go to school anymore.

- $01:01:20.300 \longrightarrow 01:01:22.480$ People don't gather in bars.
- 01:01:22.480 --> 01:01:24.027 So what do you think of this?
- $01:01:24.027 \longrightarrow 01:01:26.190$ Do you think we should make this information
- 01:01:26.190 --> 01:01:29.690 will be useful to include in our model is right?
- $01:01:29.690 \longrightarrow 01:01:31.440$ Yes I do think that.
- 01:01:31.440 --> 01:01:33.020 And just if there's a little detail there,
- $01:01:33.020 \longrightarrow 01:01:35.560$ which was seen in China and the United States
- 01:01:35.560 --> 01:01:38.790 is, ironically household transmission,
- $01:01:38.790 \longrightarrow 01:01:40.230$ cases of household transmission
- $01{:}01{:}40.230 \dashrightarrow 01{:}01{:}42.010$ typically are more severe than cases
- $01:01:42.010 \longrightarrow 01:01:44.040$ of community acquired transmission
- $01:01:44.040 \longrightarrow 01:01:45.870$ because of the viral inoculum idea.
- 01:01:45.870 --> 01:01:48.520 If I get the pathogen from my wife,
- 01:01:48.520 --> 01:01:52.510 I'm gonna get a sicker than if I get the same pathogen
- 01:01:52.510 --> 01:01:54.700 from riding in the subway,
- 01:01:54.700 --> 01:01:55.650 because I'm writing something
- 01:01:55.650 --> 01:01:57.680 I might get a low viral inoculum
- 01:01:57.680 --> 01:01:58.720 whereas if I get it from my wife,
- 01:01:58.720 --> 01:01:59.900 I'm gonna get a serious case.
- $01:01:59.900 \longrightarrow 01:02:01.800$ You know, I kiss my wife, for example.
- 01:02:03.690 --> 01:02:06.920 So intra-household transmission is often more severe
- $01:02:06.920 \dashrightarrow 01:02:11.340$ and more efficacious than out-of-household transmission
- $01:02:11.340 \longrightarrow 01:02:13.700$ So the dynamics will change in quite complicated ways,
- 01:02:13.700 --> 01:02:15.900 just like like you're alluding to,
- $01:02:15.900 \longrightarrow 01:02:18.730$ and I'm sure other groups are looking at this.
- 01:02:18.730 --> 01:02:20.730 It's not something we're actively doing.
- $01:02:21.809 \longrightarrow 01:02:23.100$ But again, if you are interested Laura,
- $01{:}02{:}23.100 \dashrightarrow 01{:}02{:}24.330$ I'm always eager to work with you,

 $01:02:24.330 \longrightarrow 01:02:25.530$ I love working with you.

 $01:02:27.450 \longrightarrow 01:02:29.150$ - All right after this (laughing).

 $01:02:30.020 \mathrel{--}{>} 01:02:32.540$ Now, do you do you wanna take one more question?

 $01:02:32.540 \longrightarrow 01:02:33.860$ - I'm happy to take one more

 $01{:}02{:}33.860 \dashrightarrow 01{:}02{:}37.840$ but pick one I wanna go so, let's do one more then stop.

01:02:37.840 --> 01:02:39.190 Anyone else have something?

 $01:02:41.600 \longrightarrow 01:02:42.510$ I'm looking around here

 $01:02:42.510 \dashrightarrow 01:02:45.353$ and all the things I need to monitor.

 $01:02:50.040 \longrightarrow 01:02:52.670$ Alright, thank you all very much.

 $01:02:52.670 \longrightarrow 01:02:54.230$ - Thank you.

 $01{:}02{:}54.230 \dashrightarrow 01{:}02{:}57.950$ Yeah, Luke says thank you for a very interesting point

 $01:02:57.950 \longrightarrow 01:03:00.350$ as we think about contact tracing.

01:03:00.350 --> 01:03:01.570 Okay.

 $01:03:01.570 \longrightarrow 01:03:03.720$ - And someone else asked about school reopening.

 $01{:}03{:}03.720 \dashrightarrow 01{:}03{:}06.890$ That's a long topic to keep people at the last minute.

 $01:03:06.890 \longrightarrow 01:03:09.500$ My wife had a nice piece in The Atlantic about this,

 $01:03:09.500 \longrightarrow 01:03:10.940$ if you're interested,

 $01{:}03{:}10.940 \dashrightarrow 01{:}03{:}12.770$ I think schools are gonna reopen,

01:03:12.770 --> 01:03:15.150 I think they need to reopen.

 $01{:}03{:}15.150 \dashrightarrow 01{:}03{:}17.200$ They're going to reopen only 'cause we have no choice

 $01{:}03{:}17.200 \dashrightarrow 01{:}03{:}19.100$ but it would be better from pandemic point of view

 $01:03:19.100 \longrightarrow 01:03:20.590$ if they did not.

01:03:20.590 --> 01:03:22.720 I think that if they're gonna reopen,

 $01:03:22.720 \longrightarrow 01:03:24.820$ a lot of procedures are gonna have to be put in place

01:03:24.820 --> 01:03:27.300 at Yale, at nursery schools, at elementary schools.

 $01{:}03{:}27.300 \dashrightarrow 01{:}03{:}30.220$ It'll be different from place to place.

 $01{:}03{:}30.220 \dashrightarrow 01{:}03{:}35.090$ And I think that there will be a second wave.

 $01:03:35.090 \longrightarrow 01:03:37.090$ So I think the schools will close again,

 $01{:}03{:}37.090 \dashrightarrow 01{:}03{:}40.123$ just what I suspect is gonna happen in October, November.

 $01:03:42.688 \longrightarrow 01:03:44.196$ Thank you all very much.

01:03:44.196 --> 01:03:45.029 - Thank you Nicholas.

01:03:45.029 --> 01:03:46.540 Thank you all for joining.

 $01:03:46.540 \longrightarrow 01:03:47.373$ Bye bye.
